risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

file:mime:macho:section

A section inside a Mach-O binary denoting a named region of bytes inside a segment.

The base type for the form can be found at *file:mime:macho:section*.

Properties:

name	type	doc
:segment	*file:mime:macho:segment*	The Mach-O segment that contains this section.
:name	*str*	Name of the section.
:size	*int*	Size of the section in bytes.
:type	*int* enums: ((0, 'regular'), (1, 'zero fill on demand'), (2, 'only literal C strings'), (3, 'only 4 byte literals'), (4, 'only 8 byte literals'), (5, 'only pointers to literals'), (6, 'only non-lazy symbol pointers'), (7, 'only lazy symbol pointers'), (8, 'only symbol stubs'), (9, 'only function pointers for init'), (10, 'only function pointers for fini'), (11, 'contains symbols to be coalesced'), (12, 'zero fill on deman (greater than 4gb)'), (13, 'only pairs of function pointers for interposing'), (14, 'only 16 byte literals'), (15, 'dtrace object format'), (16, 'only lazy symbols pointers to lazy dynamic libraries'))	The type of the section.
:sha256	*hash:sha256*	The sha256 hash of the bytes of the Mach-O section.
:offset	*int*	The file offset to the beginning of the section.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

file:mime:macho:segment

A named region of bytes inside a Mach-O binary.

The base type for the form can be found at *file:mime:macho:segment*.

Properties:

name	type	doc
:name	*str*	The name of the Mach-O segment.
:memsize	*int*	The size of the segment in bytes, when resident in memory, according to the load command structure.
:disksize	*int*	The size of the segment in bytes, when on disk, according to the load command structure.
:sha256	*hash:sha256*	The sha256 hash of the bytes of the segment.
:offset	*int*	The file offset to the beginning of the segment.
:file	*file:bytes*	The Mach-O file containing the load command.
:type	*int* enums: ((1, 'segment'), (2, 'symbol table'), (3, 'gdb symbol table'), (4, 'thread'), (5, 'unix thread'), (6, 'fixed VM shared library'), (7, 'fixed VM shared library identification'), (8, 'object identification'), (9, 'fixed VM file inclusion'), (10, 'prepage'), (11, 'dynamic link-edit symbol table'), (12, 'load dynamically linked shared library'), (13, 'dynamically linked shared library identifier'), (14, 'load dynamic linker'), (15, 'dynamic linker identification'), (16, 'prebound dynamically linked shared library'), (17, 'image routines'), (18, 'sub framework'), (19, 'sub umbrella'), (20, 'sub client'), (21, 'sub library'), (22, 'two level namespace lookup hints'), (23, 'prebind checksum'), (24, 'weak import dynamically	The type of the load command.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

file:mime:macho:uuid

A specific load command denoting a UUID used to uniquely identify the Mach-O binary.

The base type for the form can be found at *file:mime:macho:uuid*.

Properties:

name	type	doc
:uuid	*guid*	The UUID of the Mach-O application (as defined in an LC_UUID load command).
:file	*file:bytes*	The Mach-O file containing the load command.
:type	*int* enums: ((1, 'segment'), (2, 'symbol table'), (3, 'gdb symbol table'), (4, 'thread'), (5, 'unix thread'), (6, 'fixed VM shared library'), (7, 'fixed VM shared library identification'), (8, 'object identification'), (9, 'fixed VM file inclusion'), (10, 'prepage'), (11, 'dynamic link-edit symbol table'), (12, 'load dynamically linked shared library'), (13, 'dynamically linked shared library identifier'), (14, 'load dynamic linker'), (15, 'dynamic linker identification'), (16, 'prebound dynamically linked shared library'), (17, 'image routines'), (18, 'sub framework'), (19, 'sub umbrella'), (20, 'sub client'), (21, 'sub library'), (22, 'two level namespace lookup hints'), (23, 'prebind checksum'), (24, 'weak import dynamically linked shared library'), (25, '64bit segment'), (26, '64bit image routines'), (27, 'uuid'), (28, 'runpath additions'), (29, 'code signature'), (30, 'split segment info'), (31, 'load and re-export dynamic library'), (32, 'delay	The type of the load command.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

file:mime:macho:version

A specific load command used to denote the version of the source used to build the Mach-O binary.

The base type for the form can be found at *file:mime:macho:version*.

Properties:

name	type	doc
:version	*str*	The version of the Mach-O file encoded in an LC_VERSION load command.
:file	*file:bytes*	The Mach-O file containing the load command.
:type	*int* enums: ((1, 'segment'), (2, 'symbol table'), (3, 'gdb symbol table'), (4, 'thread'), (5, 'unix thread'), (6, 'fixed VM shared library'), (7, 'fixed VM shared library identification'), (8, 'object identification'), (9, 'fixed VM file inclusion'), (10, 'prepage'), (11, 'dynamic link-edit symbol table'), (12, 'load dynamically linked shared library'), (13, 'dynamically linked shared library identifier'), (14, 'load dynamic linker'), (15, 'dynamic linker identification'), (16, 'prebound dynamically linked shared library'), (17, 'image routines'), (18, 'sub framework'), (19, 'sub umbrella'), (20, 'sub client'), (21, 'sub library'), (22, 'two level namespace lookup hints'), (23, 'prebind checksum'), (24, 'weak import dynamically linked shared library'), (25, '64bit segment'), (26, '64bit image routines'), (27, 'uuid'), (28, 'runpath additions'), (29, 'code signature'), (30, 'split segment info'), (31, 'load and re-export dynamic library'), (32, 'delay	The type of the load command.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

file:mime:msdoc

The GUID of a set of mime metadata for a Microsoft Word file.

The base type for the form can be found at *file:mime:msdoc*.

Properties:

name	type	doc
:title	*str*	The title extracted from Microsoft Office metadata.
:author	*str*	The author extracted from Microsoft Office metadata.
:subject	*str*	The subject extracted from Microsoft Office metadata.
:application	*str*	The creating_application extracted from Microsoft Office metadata.
:created	*time*	The create_time extracted from Microsoft Office metadata.
:lastsaved	*time*	The last_saved_time extracted from Microsoft Office metadata.
:file	*file:bytes*	The file that the mime info was parsed from.
:file:offs	*int*	The optional offset where the mime info was parsed from.
:file:data	*data*	A mime specific arbitrary data structure for non-indexed data.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

file:mime:pe:export

The fused knowledge of a file:bytes node containing a pe named export.

The base type for the form can be found at *file:mime:pe:export*.

Properties:

name	type	doc	opts
:file	*file:bytes*	The file containing the export.	Read Only: True
:name	*str*	The name of the export in the file.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.

continues on next page

Table 82 – continued from previous page

source	verb	target	doc
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

file:mime:pe:resource

The fused knowledge of a file:bytes node containing a pe resource.

The base type for the form can be found at *file:mime:pe:resource*.

Properties:

name	type	doc	opts
:file	*file:bytes*	The file containing the resource.	Read Only: True
:type	*pe:resource:type*	The typecode for the resource.	Read Only: True
:langid	*pe:langid*	The language code for the resource.	Read Only: True
:resource	*file:bytes*	The sha256 hash of the resource bytes.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.

continues on next page

Table 83 – continued from previous page

source	verb	target	doc
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

file:mime:pe:section

The fused knowledge a file:bytes node containing a pe section.

The base type for the form can be found at *file:mime:pe:section*.

Properties:

name	type	doc	opts
:file	*file:bytes*	The file containing the section.	Read Only: True
:name	*str*	The textual name of the section.	Read Only: True
:sha25(	*hash:sha25*	The sha256 hash of the section. Relocations must be zeroed before hashing.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.

Table 84 – continued from previous page

source	verb	target	doc
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

file:mime:pe:vsvers:info

knowledge of a file:bytes node containing vsvers info.

The base type for the form can be found at *file:mime:pe:vsvers:info*.

Properties:

name	type	doc	opts
:file	*file:bytes*	The file containing the vsversion keyval pair.	Read Only: True
:keyval	*file:mime:pe:vsvers:keyv*	The vsversion info keyval in this file:bytes node.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

file:mime:pe:vsvers:keyval

A key value pair found in a PE vsversion info structure.

The base type for the form can be found at *file:mime:pe:vsvers:keyval*.

Properties:

name	type	doc	opts
:name	*str*	The key for the vsversion keyval pair.	Read Only: True
:value	*str*	The value for the vsversion keyval pair.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.

Table 86 – continued from previous page

source	verb	target	doc
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

file:mime:png

The GUID of a set of mime metadata for a .png file.

The base type for the form can be found at *file:mime:png*.

Properties:

name	type	doc
:desc	*str*	MIME specific description field extracted from metadata.
:comment	*str*	MIME specific comment field extracted from metadata.
:created	*time*	MIME specific creation timestamp extracted from metadata.
:imageid	*str*	MIME specific unique identifier extracted from metadata.
:author	*ps:contact*	MIME specific contact information extracted from metadata.
:latlong	*geo:latlong*	MIME specific lat/long information extracted from metadata.
:altitude	*geo:altitude*	MIME specific altitude information extracted from metadata.
:text	*str* lower: True onespace: True	The text contained within the image.
:file	*file:bytes*	The file that the mime info was parsed from.
:file:offs	*int*	The optional offset where the mime info was parsed from.
:file:data	*data*	A mime specific arbitrary data structure for non-indexed data.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

file:mime:rtf

The GUID of a set of mime metadata for a .rtf file.

The base type for the form can be found at *file:mime:rtf* .

Properties:

name	type	doc
:guid	*guid*	The parsed GUID embedded in the .rtf file.
:file	*file:bytes*	The file that the mime info was parsed from.
:file:offs	*int*	The optional offset where the mime info was parsed from.
:file:data	*data*	A mime specific arbitrary data structure for non-indexed data.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.

sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

file:mime:tif

The GUID of a set of mime metadata for a .tif file.

The base type for the form can be found at *file:mime:tif* .

Properties:

name	type	doc
:desc	*str*	MIME specific description field extracted from metadata.
:comment	*str*	MIME specific comment field extracted from metadata.
:created	*time*	MIME specific creation timestamp extracted from metadata.
:imageid	*str*	MIME specific unique identifier extracted from metadata.
:author	*ps:contact*	MIME specific contact information extracted from metadata.
:latlong	*geo:latlong*	MIME specific lat/long information extracted from metadata.
:altitude	*geo:altitude*	MIME specific altitude information extracted from metadata.
:text	*str* lower: True onespace: True	The text contained within the image.
:file	*file:bytes*	The file that the mime info was parsed from.
:file:offs	*int*	The optional offset where the mime info was parsed from.
:file:data	*data*	A mime specific arbitrary data structure for non-indexed data.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

file:path

A normalized file path.

The base type for the form can be found at *file:path*.

An example of `file:path`:

- `c:/windows/system32/calc.exe`

Properties:

name	type	doc	opts
:dir	*file:path*	The parent directory.	Read Only: True
:base	*file:base*	The file base name.	Read Only: True
:base:ext	*str*	The file extension.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.

geo:nloc

Records a node latitude/longitude in space-time.

The base type for the form can be found at *geo:nloc*.

Properties:

name	type	doc	opts
:ndef	*ndef*	The node with location in geospace and time.	Read Only: True
:ndef:form	*str*	The form of node referenced by the ndef.	Read Only: True
:latlong	*geo:latlong*	The latitude/longitude the node was observed.	Read Only: True
:time	*time*	The time the node was observed at location.	Read Only: True
:place	*geo:place*	The place corresponding to the latlong property.	
:loc	*loc*	The geo-political location string for the node.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

sci:observation	-(has)>	*	The observations are summarized from the target nodes.

geo:place

A GUID for a geographic place.

The base type for the form can be found at *geo:place*.

Properties:

name	type	doc	opts
:name	*geo:name*	The name of the place.	
:type	*geo:place:taxonomy*	The type of place.	
:names	*array* type: *geo:name* sorted: True uniq: True	An array of alternative place names.	
:parent	*geo:place*	Deprecated. Please use a -(contains)> edge.	Deprecated: True
:desc	*str*	A long form description of the place.	
:loc	*loc*	The geo-political location string for the node.	
:address	*geo:address*	The street/mailing address for the place.	
:geojson	*geo:json*	A GeoJSON representation of the place.	
:latlong	*geo:latlong*	The lat/long position for the place.	
:bbox	*geo:bbox*	A bounding box which encompasses the place.	
:radius	*geo:dist*	An approximate radius to use for bounding box calculation.	
:photo	*file:bytes*	The image file to use as the primary image of the place.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.
geo:plac	-(contains)	geo:place	The source place completely contains the target place.

Target Edges:

source	verb	target	doc

sci:observation	-(has)>	*	The observations are summarized from the target nodes.

geo:place:taxonomy

A taxonomy of place types.

The base type for the form can be found at *geo:place:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*geo:place:taxonomy*	The taxonomy parent.	Read Only: True

Source Edges:

sci:observation	-(has)>	*	The observations are summarized from the target nodes.

geo:telem

A geospatial position of a node at a given time. The node should be linked via -(seenat)> edges.

The base type for the form can be found at *geo:telem*.

Properties:

name	type	doc
:time	*time*	The time that the node was at the position.
:desc	*str*	A description of the telemetry sample.
:latlong	*geo:latlong*	The latitude/longitude reading at the time.
:accuracy	*geo:dist*	The reported accuracy of the latlong telemetry reading.
:place	*geo:place*	The place which includes the latlong value.
:place:name	*geo:name*	The purported place name. Used for entity resolution.

Source Edges:

source	verb	target	doc

ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

gov:cn:mucd

A Chinese PLA MUCD.

The base type for the form can be found at *gov:cn:mucd*.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

gov:us:cage

A Commercial and Government Entity (CAGE) code.

The base type for the form can be found at *gov:us:cage*.

Properties:

name	type	doc
:name0	*ou:name*	The name of the organization.
:name1	*str* lower: True	Name Part 1.
:street	*str* lower: True	The base string type.
:city	*str* lower: True	The base string type.
:state	*str* lower: True	The base string type.
:zip	*gov:us:zip*	A US Postal Zip Code.
:cc	*pol:iso2*	The 2 digit ISO 3166 country code.
:country	*str* lower: True	The base string type.
:phone0	*tel:phone*	A phone number.
:phone1	*tel:phone*	A phone number.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

gov:us:ssn

A US Social Security Number (SSN).

The base type for the form can be found at *gov:us:ssn*.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc

econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

gov:us:zip

A US Postal Zip Code.

The base type for the form can be found at *gov:us:zip*.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

graph:cluster

A generic node, used in conjunction with Edge types, to cluster arbitrary nodes to a single node in the model.

The base type for the form can be found at *graph:cluster*.

Properties:

name	type	doc
:name	*str* lower: True	A human friendly name for the cluster.
:desc	*str* lower: True	A human friendly long form description for the cluster.
:type	*str* lower: True	An optional type field used to group clusters.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.

source	verb	target	doc
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

graph:edge

A generic digraph edge to show relationships outside the model.

The base type for the form can be found at *graph:edge*.

Properties:

name	type	doc	opts
:n1	*ndef*	The node definition type for a (form,valu) compound field.	Read Only: True
:n1:form	*str*	The base string type.	Read Only: True
:n2	*ndef*	The node definition type for a (form,valu) compound field.	Read Only: True
:n2:form	*str*	The base string type.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc

Table 104 – continued from previous page

source	verb	target	doc
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

graph:event

A generic event node to represent events outside the model.

The base type for the form can be found at *graph:event*.

Properties:

name	type	doc
:time	*time*	The time of the event.
:type	*str*	A arbitrary type string for the event.
:name	*str*	A name for the event.
:data	*data*	Arbitrary non-indexed msgpack data attached to the event.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

graph:node

A generic node used to represent objects outside the model.

The base type for the form can be found at *graph:node*.

Properties:

name	type	doc
:type	*str*	The type name for the non-model node.
:name	*str*	A human readable name for this record.
:data	*data*	Arbitrary non-indexed msgpack data attached to the node.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

graph:timeedge

A generic digraph time edge to show relationships outside the model.

The base type for the form can be found at *graph:timeedge*.

Properties:

name	type	doc	opts
:time	*time*	A date/time value.	Read Only: True
:n1	*ndef*	The node definition type for a (form,valu) compound field.	Read Only: True
:n1:form	*str*	The base string type.	Read Only: True
:n2	*ndef*	The node definition type for a (form,valu) compound field.	Read Only: True
:n2:form	*str*	The base string type.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:client

A network client address.

The base type for the form can be found at *inet:client*.

An example of `inet:client`:

- `tcp://1.2.3.4:80`

Properties:

name	type	doc	opts
`:proto`	*str* lower: `True`	The network protocol of the client.	Read Only: `True`
`:ipv4`	*inet:ipv4*	The IPv4 of the client.	Read Only: `True`
`:ipv6`	*inet:ipv6*	The IPv6 of the client.	Read Only: `True`
`:host`	*it:host*	The it:host node for the client.	Read Only: `True`
`:port`	*inet:port*	The client tcp/udp port.	

Source Edges:

source	verb	target	doc
`*`	`-(meets)>`	`ou:requireme`	The requirement is met by the source node.
`*`	`-(refs)>`	`*`	The source node contains a reference to the target node.
`*`	`-(seenat)`	`geo:telem`	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
`*`	`-(refs)>`	`*`	None
`econ:purchase`	`-(acquired)>`	`*`	The purchase was used to acquire the target node.
`it:app:snort:rule`	`-(detects)>`	`*`	The snort rule is intended for use in detecting the target node.
`it:app:yara:rule`	`-(detects)>`	`*`	The YARA rule is intended for use in detecting the target nod
`it:exec:query`	`-(found)>`	`*`	The target node was returned as a result of running the query.
`meta:note`	`-(about)>`	`*`	The meta:note is about the target node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:dns:a

The result of a DNS A record lookup.

The base type for the form can be found at *inet:dns:a*.

An example of `inet:dns:a`:

- `(vertex.link,1.2.3.4)`

Properties:

name	type	doc	opts
:fqdn	*inet:fqdn*	The domain queried for its DNS A record.	Read Only: `True`
:ipv4	*inet:ipv4*	The IPv4 address returned in the A record.	Read Only: `True`

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:dns:answer

A single answer from within a DNS reply.

The base type for the form can be found at *inet:dns:answer*.

Properties:

name	type	doc
:ttl	*int*	The base 64 bit signed integer type.
:request	*inet:dns:request*	A single instance of a DNS resolver request and optional reply info.
:a	*inet:dns:a*	The DNS A record returned by the lookup.
:ns	*inet:dns:ns*	The DNS NS record returned by the lookup.
:rev	*inet:dns:rev*	The DNS PTR record returned by the lookup.
:aaaa	*inet:dns:aaaa*	The DNS AAAA record returned by the lookup.
:rev6	*inet:dns:rev6*	The DNS PTR record returned by the lookup of an IPv6 address.
:cname	*inet:dns:cname*	The DNS CNAME record returned by the lookup.
:mx	*inet:dns:mx*	The DNS MX record returned by the lookup.
:mx:priority	*int*	The DNS MX record priority.
:soa	*inet:dns:soa*	The domain queried for its SOA record.
:txt	*inet:dns:txt*	The DNS TXT record returned by the lookup.
:time	*time*	The time that the DNS response was transmitted.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc

source	verb	target	doc
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:dns:cname

The result of a DNS CNAME record lookup.

The base type for the form can be found at *inet:dns:cname*.

An example of `inet:dns:cname`:

- `(foo.vertex.link,vertex.link)`

Properties:

name	type	doc	opts
:fqdn	*inet:fqdn*	The domain queried for its CNAME record.	Read Only: True
:cname	*inet:fqdn*	The domain returned in the CNAME record.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

inet:dns:dynreg

A dynamic DNS registration.

The base type for the form can be found at *inet:dns:dynreg*.

Properties:

name	type	doc
:fqdn	*inet:fqdn*	The FQDN registered within a dynamic DNS provider.
:provider	*ou:org*	The organization which provides the dynamic DNS FQDN.
:provider:name	*ou:name*	The name of the organization which provides the dynamic DNS FQDN.
:provider:fqdn	*inet:fqdn*	The FQDN of the organization which provides the dynamic DNS FQDN.
:contact	*ps:contact*	The contact information of the registrant.
:created	*time*	The time that the dynamic DNS registration was first created.
:client	*inet:client*	The network client address used to register the dynamic FQDN.
:client:ipv4	*inet:ipv4*	The client IPv4 address used to register the dynamic FQDN.
:client:ipv6	*inet:ipv6*	The client IPv6 address used to register the dynamic FQDN.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requirement	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.

Table 124 – continued from previous page

source	verb	target	doc
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:dns:mx

The result of a DNS MX record lookup.

The base type for the form can be found at *inet:dns:mx*.

An example of `inet:dns:mx`:

- `(vertex.link,mail.vertex.link)`

Properties:

name	type	doc	opts
:fqdn	*inet:fqdn*	The domain queried for its MX record.	Read Only: True
:mx	*inet:fqdn*	The domain returned in the MX record.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.

Table 125 – continued from previous page

source	verb	target	doc
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:dns:ns

The result of a DNS NS record lookup.

The base type for the form can be found at *inet:dns:ns*.

An example of `inet:dns:ns`:

- `(vertex.link,ns.dnshost.com)`

Properties:

name	type	doc	opts
:zone	*inet:fqdn*	The domain queried for its DNS NS record.	Read Only: True
:ns	*inet:fqdn*	The domain returned in the NS record.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:dns:query

A DNS query unique to a given client.

The base type for the form can be found at *inet:dns:query*.

An example of `inet:dns:query`:

- `(1.2.3.4, woot.com, 1)`

  Properties:

name	type	doc	opts
:client	*inet:client*	A network client address.	Read Only: True
:name	*inet:dns:nar*	A DNS query name string. Likely an FQDN but not always.	Read Only: True
:name:ipv	*inet:ipv4*	An IPv4 address.	
:name:ipv	*inet:ipv6*	An IPv6 address.	
:name:fqc	*inet:fqdn*	A Fully Qualified Domain Name (FQDN).	
:type	*int*	The base 64 bit signed integer type.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.

continues on next

Table 127 – continued from previous page

source	verb	target	doc
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:dns:request

A single instance of a DNS resolver request and optional reply info.

The base type for the form can be found at *inet:dns:request*.

Properties:

name	type	doc
:time	*time*	A date/time value.
:query	*inet:dns:query*	A DNS query unique to a given client.
:query:name	*inet:dns:name*	A DNS query name string. Likely an FQDN but not always.
:query:name:ipv4	*inet:ipv4*	An IPv4 address.
:query:name:ipv6	*inet:ipv6*	An IPv6 address.
:query:name:fqdn	*inet:fqdn*	A Fully Qualified Domain Name (FQDN).
:query:type	*int*	The base 64 bit signed integer type.
:server	*inet:server*	A network server address.
:reply:code	*int*	The DNS server response code.
:exe	*file:bytes*	The file containing the code that attempted the DNS lookup.
:proc	*it:exec:proc*	The process that attempted the DNS lookup.
:host	*it:host*	The host that attempted the DNS lookup.
:sandbox:file	*file:bytes*	The initial sample given to a sandbox environment to analyze.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.

source	verb	target	doc
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:dns:rev

The transformed result of a DNS PTR record lookup.

The base type for the form can be found at *inet:dns:rev*.

An example of `inet:dns:rev`:

- `(1.2.3.4,vertex.link)`

Properties:

name	type	doc	opts
:ipv4	*inet:ipv4*	The IPv4 address queried for its DNS PTR record.	Read Only: True
:fqdn	*inet:fqdn*	The domain returned in the PTR record.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target

risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:dns:rev6

The transformed result of a DNS PTR record for an IPv6 address.

The base type for the form can be found at *inet:dns:rev6*.

An example of `inet:dns:rev6`:

- `(2607:f8b0:4004:809::200e,vertex.link)`

Properties:

name	type	doc	opts
:ipv6	*inet:ipv6*	The IPv6 address queried for its DNS PTR record.	Read Only: True
:fqdn	*inet:fqdn*	The domain returned in the PTR record.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:dns:soa

The result of a DNS SOA record lookup.

The base type for the form can be found at *inet:dns:soa*.

Properties:

name	type	doc
:fqdn	*inet:fqdn*	The domain queried for its SOA record.
:ns	*inet:fqdn*	The domain (MNAME) returned in the SOA record.
:email	*inet:email*	The email address (RNAME) returned in the SOA record.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.

sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:dns:txt

The result of a DNS MX record lookup.

The base type for the form can be found at *inet:dns:txt*.

An example of `inet:dns:txt`:

- `(hehe.vertex.link,"fancy TXT record")`

  Properties:

name	type	doc	opts
:fqdn	*inet:fqdn*	The domain queried for its TXT record.	Read Only: True
:txt	*str*	The string returned in the TXT record.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc

inet:download

An instance of a file downloaded from a server.

The base type for the form can be found at *inet:download*.

Properties:

name	type	doc
:time	*time*	The time the file was downloaded.
:fqdn	*inet:fqdn*	The FQDN used to resolve the server.
:file	*file:bytes*	The file that was downloaded.
:server	*inet:server*	The inet:addr of the server.
:server:host	*it:host*	The it:host node for the server.
:server:ipv4	*inet:ipv4*	The IPv4 of the server.
:server:ipv6	*inet:ipv6*	The IPv6 of the server.
:server:port	*inet:port*	The server tcp/udp port.
:server:proto	*str* lower: True	The server network layer protocol.
:client	*inet:client*	The inet:addr of the client.
:client:host	*it:host*	The it:host node for the client.
:client:ipv4	*inet:ipv4*	The IPv4 of the client.
:client:ipv6	*inet:ipv6*	The IPv6 of the client.
:client:port	*inet:port*	The client tcp/udp port.
:client:proto	*str* lower: True	The client network layer protocol.

inet:egress

A host using a specific network egress client address.

The base type for the form can be found at *inet:egress*.

Properties:

name	type	doc
:host	*it:host*	The host that used the network egress.
:client	*inet:client*	The client address the host used as a network egress.
:client:ipv4	*inet:ipv4*	The client IPv4 address the host used as a network egress.
:client:ipv6	*inet:ipv6*	The client IPv6 address the host used as a network egress.

Source Edges:

sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:email:message

An individual email message delivered to an inbox.

The base type for the form can be found at *inet:email:message*.

Properties:

name	type	doc	opts
:to	*inet:email*	The email address of the recipient.	
:from	*inet:email*	The email address of the sender.	
:replyto	*inet:email*	The email address parsed from the "reply-to" header.	
:cc	*array* type: *inet:email* uniq: True sorted: True	Email addresses parsed from the "cc" header.	
:subject	*str*	The email message subject parsed from the "subject" header.	
:body	*str*	The body of the email message.	Display: {'hint': 'text'}
:date	*time*	The time the email message was delivered.	
:bytes	*file:bytes*	The file bytes which contain the email message.	
:headers	*array* type: *inet:email:header*	An array of email headers from the message.	
:received:from:ipv	*inet:ipv4*	The sending SMTP server IPv4, potentially from the Received: header.	
:received:from:ipv	*inet:ipv6*	The sending SMTP server IPv6, potentially from the Received: header.	
:received:from:fqd	*inet:fqdn*	The sending server FQDN, potentially from the Received: header.	
:flow	*inet:flow*	The inet:flow which delivered the message.	

Source Edges:

source	verb	target	doc

meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.

Table 140 – continued from previous page

source	verb	target	doc
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:email:message:link

A url/link embedded in an email message.

The base type for the form can be found at *inet:email:message:link*.

Properties:

name	type	doc	opts
:message	*inet:email:messag*	The message containing the embedded link.	Read Only: True
:url	*inet:url*	The url contained within the email message.	Read Only: True
:text	*str*	The displayed hyperlink text if it was not the raw URL.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:flow

An individual network connection between a given source and destination.

The base type for the form can be found at *inet:flow*.

Properties:

name	type	doc	opts
:time	*time*	The time the network connection was initiated.	
:duration	*int*	The duration of the flow in seconds.	
:from	*guid*	The ingest source file/iden. Used for reparsing.	
:dst	*inet:server*	The destination address / port for a connection.	
:dst:ipv4	*inet:ipv4*	The destination IPv4 address.	
:dst:ipv6	*inet:ipv6*	The destination IPv6 address.	
:dst:port	*inet:port*	The destination port.	
:dst:proto	*str* lower: True	The destination protocol.	

continues on next page

Table 142 – continued from previous page

name	type	doc	opts
`:dst:host`	*it:host*	The guid of the destination host.	
`:dst:proc`	*it:exec:proc*	The guid of the destination process.	
`:dst:exe`	*file:bytes*	The file (executable) that received the connection.	
`:dst:txcount`	*int*	The number of packets sent by the destination host.	
`:dst:txbytes`	*int*	The number of bytes sent by the destination host.	
`:dst:handshake`	*str*	A text representation of the initial handshake sent by the server.	Display: `{'hint': 'text'}`
`:src`	*inet:client*	The source address / port for a connection.	
`:src:ipv4`	*inet:ipv4*	The source IPv4 address.	
`:src:ipv6`	*inet:ipv6*	The source IPv6 address.	
`:src:port`	*inet:port*	The source port.	
`:src:proto`	*str* lower: `True`	The source protocol.	
`:src:host`	*it:host*	The guid of the source host.	
`:src:proc`	*it:exec:proc*	The guid of the source process.	
`:src:exe`	*file:bytes*	The file (executable) that created the connection.	
`:src:txcount`	*int*	The number of packets sent by the source host.	
`:src:txbytes`	*int*	The number of bytes sent by the source host.	
`:tot:txcount`	*int*	The number of packets sent in both directions.	
`:tot:txbytes`	*int*	The number of bytes sent in both directions.	

continues on next page

Table 142 – continued from previous page

name	type	doc	opts
:src:handshake	*str*	A text representation of the initial handshake sent by the client.	Display: {'hint': 'text'}
:dst:cpes	*array* type: *it:sec:cpe* uniq: True sorted: True	An array of NIST CPEs identified on the destination host.	
:dst:softnames	*array* type: *it:prod:softname* uniq: True sorted: True	An array of software names identified on the destination host.	
:src:cpes	*array* type: *it:sec:cpe* uniq: True sorted: True	An array of NIST CPEs identified on the source host.	
:src:softnames	*array* type: *it:prod:softname* uniq: True sorted: True	An array of software names identified on the source host.	
:ip:proto	*int* min: 0 max: 255	The IP protocol number of the flow.	
:ip:tcp:flags	*int* min: 0 max: 255	An aggregation of observed TCP flags commonly provided by flow APIs.	
:sandbox:file	*file:bytes*	The initial sample given to a sandbox environment to analyze.	
:src:ssl:cert	*crypto:x509:cert*	The x509 certificate sent by the client as part of an SSL/TLS negotiation.	

continues on next page

Table 142 – continued from previous page

name	type	doc	opts
:dst:ssl:cert	*crypto:x509:cert*	The x509 certificate sent by the server as part of an SSL/TLS negotiation.	
:src:rdp:hostname	*it:hostname*	The hostname sent by the client as part of an RDP session setup.	
:src:rdp:keyboard:	*str* lower: True onespace: True	The keyboard layout sent by the client as part of an RDP session setup.	
:src:ssh:key	*crypto:key*	The key sent by the client as part of an SSH session setup.	
:dst:ssh:key	*crypto:key*	The key sent by the server as part of an SSH session setup.	
:raw	*data*	A raw record used to create the flow which may contain additional protocol details.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.

risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:fqdn

A Fully Qualified Domain Name (FQDN).

The base type for the form can be found at *inet:fqdn*.

An example of `inet:fqdn`:

- `vertex.link`

Properties:

name	type	doc	opts
:domain	*inet:fqdn*	The parent domain for the FQDN.	Read Only: `True`
:host	*str* lower: `True`	The host part of the FQDN.	Read Only: `True`
:issuffix	*bool*	True if the FQDN is considered a suffix.	
:iszone	*bool*	True if the FQDN is considered a zone.	
:zone	*inet:fqdn*	The zone level parent for this FQDN.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:group

A group name string.

The base type for the form can be found at *inet:group*.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:http:cookie

An individual HTTP cookie string.

The base type for the form can be found at *inet:http:cookie*.

An example of `inet:http:cookie`:

- `PHPSESSID=el4ukv0kqbvoirg7nkp4dncpk3`

Properties:

name	type	doc
:name	*str*	The name of the cookie preceding the equal sign.
:value	*str*	The value of the cookie after the equal sign if present.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.

Table 146 – continued from previous page

source	verb	target	doc
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:http:param

An HTTP request path query parameter.

The base type for the form can be found at *inet:http:param*.

Properties:

name	type	doc	opts
:name	*str* lower: True	The name of the HTTP query parameter.	Read Only: True
:value	*str*	The value of the HTTP query parameter.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:http:request

A single HTTP request.

The base type for the form can be found at *inet:http:request*.

Properties:

name	type	doc
:method	*str*	The HTTP request method string.
:path	*str*	The requested HTTP path (without query parameters).
:url	*inet:url*	The reconstructed URL for the request if known.
:query	*str*	The HTTP query string which optionally follows the path.
:headers	*array* type: *inet:http:request:header*	An array of HTTP headers from the request.
:body	*file:bytes*	The body of the HTTP request.

continues on next page

Table 148 – continued from previous page

name	type	doc
:referer	*inet:url*	The referer URL parsed from the "Referer:" header in the request.
:cookies	*array* type: *inet:http:cookie* sorted: True uniq: True	An array of HTTP cookie values parsed from the "Cookies:" header in the request.
:response:time	*time*	A date/time value.
:response:code	*int*	The base 64 bit signed integer type.
:response:reason	*str*	The base string type.
:response:headers	*array* type: *inet:http:response:header*	An array of HTTP headers from the response.
:response:body	*file:bytes*	The file bytes type with SHA256 based primary property.
:session	*inet:http:session*	The HTTP session this request was part of.
:flow	*inet:flow*	The raw inet:flow containing the request.
:client	*inet:client*	The inet:addr of the client.
:client:ipv4	*inet:ipv4*	The server IPv4 address that the request was sent from.
:client:ipv6	*inet:ipv6*	The server IPv6 address that the request was sent from.
:client:host	*it:host*	The host that the request was sent from.
:server	*inet:server*	The inet:addr of the server.
:server:ipv4	*inet:ipv4*	The server IPv4 address that the request was sent to.
:server:ipv6	*inet:ipv6*	The server IPv6 address that the request was sent to.
:server:port	*inet:port*	The server port that the request was sent to.
:server:host	*it:host*	The host that the request was sent to.
:exe	*file:bytes*	The executable file which caused the activity.
:proc	*it:exec:proc*	The host process which caused the activity.
:thread	*it:exec:thread*	The host thread which caused the activity.
:host	*it:host*	The host on which the activity occurred.

econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.

source	verb	target	doc
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:http:request:header

An HTTP request header.

The base type for the form can be found at *inet:http:request:header*.

Properties:

name	type	doc	opts
:name	*inet:http:header:name*	The name of the HTTP request header.	Read Only: True
:value	*str*	The value of the HTTP request header.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:iface

A network interface with a set of associated protocol addresses.

The base type for the form can be found at *inet:iface*.

Properties:

name	type	doc
:host	*it:host*	The guid of the host the interface is associated with.
:network	*it:network*	The guid of the it:network the interface connected to.
:type	*str* lower: True	The free-form interface type.
:mac	*inet:mac*	The ethernet (MAC) address of the interface.
:ipv4	*inet:ipv4*	The IPv4 address of the interface.
:ipv6	*inet:ipv6*	The IPv6 address of the interface.
:phone	*tel:phone*	The telephone number of the interface.
:wifi:ssid	*inet:wifi:ssid*	The wifi SSID of the interface.
:wifi:bssid	*inet:mac*	The wifi BSSID of the interface.
:adid	*it:adid*	An advertising ID associated with the interface.
:mob:imei	*tel:mob:imei*	The IMEI of the interface.
:mob:imsi	*tel:mob:imsi*	The IMSI of the interface.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc

sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:ipv4

An IPv4 address.

The base type for the form can be found at *inet:ipv4*.

An example of `inet:ipv4`:

- `1.2.3.4`

Properties:

name	type	doc
:asn	*inet:asn*	The ASN to which the IPv4 address is currently assigned.
:latlong	*geo:latlong*	The best known latitude/longitude for the node.
:loc	*loc*	The geo-political location string for the IPv4.
:place	*geo:place*	The geo:place associated with the latlong property.
:type	*str*	The type of IP address (e.g., private, multicast, etc.).
:dns:rev	*inet:fqdn*	The most current DNS reverse lookup for the IPv4.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
inet:whois:iprec	-(ipwhois)>	inet:ipv4	The source IP whois record describes the target IPv4 add
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the targe
it:exec:query	-(found)>	*	The target node was returned as a result of running the q
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the targe
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target no
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the co
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the t
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target node
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:ipv6

An IPv6 address.

The base type for the form can be found at *inet:ipv6*.

An example of `inet:ipv6`:

- `2607:f8b0:4004:809::200e`

Properties:

name	type	doc
:asn	*inet:asn*	The ASN to which the IPv6 address is currently assigned.
:ipv4	*inet:ipv4*	The mapped ipv4.
:latlong	*geo:latlong*	The last known latitude/longitude for the node.
:place	*geo:place*	The geo:place associated with the latlong property.
:dns:rev	*inet:fqdn*	The most current DNS reverse lookup for the IPv6.
:loc	*loc*	The geo-political location string for the IPv6.
:type	*str*	The type of IP address (e.g., private, multicast, etc.).
:scope	*str* enums: reserved, interface-local, link-local, realm-local, admin-local, site-local, organization-local, global,unassigned	The IPv6 scope of the address (e.g., global, link-local, etc.).

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
inet:whois:iprec	-(ipwhois)>	inet:ipv6	The source IP whois record describes the target IPv6 add
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the targe
it:exec:query	-(found)>	*	The target node was returned as a result of running the q
meta:note	-(about)>	*	The meta:note is about the target node.

Table 155 – continued from previous page

source	verb	target	doc
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the targe
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target no
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the co
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the t
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target node
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:mac

A 48-bit Media Access Control (MAC) address.

The base type for the form can be found at *inet:mac*.

An example of `inet:mac`:

- `aa:bb:cc:dd:ee:ff`

Properties:

name	type	doc
:vendor	*str*	The vendor associated with the 24-bit prefix of a MAC address.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:passwd

A password string.

The base type for the form can be found at *inet:passwd*.

Properties:

name	type	doc	opts
:md5	*hash:md5*	The MD5 hash of the password.	Read Only: True
:sha1	*hash:sha1*	The SHA1 hash of the password.	Read Only: True
:sha256	*hash:sha256*	The SHA256 hash of the password.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:proto

A network protocol name.

The base type for the form can be found at *inet:proto*.

Properties:

name	type	doc
:port	*inet:port*	The default port this protocol typically uses if applicable.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.

Table 158 – continued from previous page

source	verb	target	doc
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:rfc2822:addr

An RFC 2822 Address field.

The base type for the form can be found at *inet:rfc2822:addr*.

An example of `inet:rfc2822:addr`:

- `"Visi Kenshoto" <visi@vertex.link>`

Properties:

name	type	doc	opts
:name	*ps:name*	The name field parsed from an RFC 2822 address string.	Read Only: True
:email	*inet:email*	The email field parsed from an RFC 2822 address string.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.

Table 159 – continued from previous page

source	verb	target	doc
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:search:query

An instance of a search query issued to a search engine.

The base type for the form can be found at *inet:search:query*.

Properties:

name	type	doc	opts
:text	*str*	The search query text.	Display: {'hint': 'text'}
:time	*time*	The time the web search was issued.	
:acct	*inet:web:acct*	The account that the query was issued as.	
:host	*it:host*	The host that issued the query.	
:engine	*str* lower: True	A simple name for the search engine used.	Example: google
:request	*inet:http:request*	The HTTP request used to issue the query.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:search:result

A single result from a web search.

The base type for the form can be found at *inet:search:result*.

Properties:

name	type	doc
:query	*inet:search:query*	The search query that produced the result.
:title	*str* lower: True	The title of the matching web page.
:rank	*int*	The rank/order of the query result.
:url	*inet:url*	The URL hosting the matching content.
:text	*str* lower: True	Extracted/matched text from the matched content.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.

Table 161 – continued from previous page

source	verb	target	doc
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:server

A network server address.

The base type for the form can be found at *inet:server*.

An example of `inet:server`:

- `tcp://1.2.3.4:80`

Properties:

name	type	doc	opts
:proto	*str* lower: True	The network protocol of the server.	Read Only: True
:ipv4	*inet:ipv4*	The IPv4 of the server.	Read Only: True
:ipv6	*inet:ipv6*	The IPv6 of the server.	Read Only: True
:host	*it:host*	The it:host node for the server.	Read Only: True
:port	*inet:port*	The server tcp/udp port.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:servfile

A file hosted on a server for access over a network protocol.

The base type for the form can be found at *inet:servfile*.

Properties:

name	type	doc	opts
:file	*file:bytes*	The file hosted by the server.	Read Only: True
:server	*inet:server*	The inet:addr of the server.	Read Only: True
:server:proto	*str* lower: True	The network protocol of the server.	Read Only: True
:server:ipv4	*inet:ipv4*	The IPv4 of the server.	Read Only: True
:server:ipv6	*inet:ipv6*	The IPv6 of the server.	Read Only: True
:server:host	*it:host*	The it:host node for the server.	Read Only: True
:server:port	*inet:port*	The server tcp/udp port.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.

inet:ssl:jarmhash

A TLS JARM fingerprint hash.

The base type for the form can be found at *inet:ssl:jarmhash*.

Properties:

name	type	doc	opts
:ciphers	*str* lower: True strip: True regex: `^[0-9a-f]{30}$`	The encoded cipher and TLS version of the server.	Read Only: True
:extensions	*str* lower: True strip: True regex: `^[0-9a-f]{32}$`	The truncated SHA256 of the TLS server extensions.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.

risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:ssl:jarmsample

A JARM hash sample taken from a server.

The base type for the form can be found at *inet:ssl:jarmsample*.

Properties:

name	type	doc	opts
:jarmhash	*inet:ssl:jarmhas*	The JARM hash computed from the server responses.	Read Only: True
:server	*inet:server*	The server that was sampled to compute the JARM hash.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.

Table 166 – continued from previous page

source	verb	target	doc
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:tls:clientcert

An x509 certificate sent by a client for TLS.

The base type for the form can be found at *inet:tls:clientcert*.

An example of `inet:tls:clientcert`:

- `(1.2.3.4:443, 3fdf364e081c14997b291852d1f23868)`

Properties:

name	type	doc	opts
:client	*inet:client*	The client associated with the x509 certificate.	Read Only: True
:cert	*crypto:x509:cer*	The x509 certificate sent by the client.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:tls:handshake

An instance of a TLS handshake between a server and client.

The base type for the form can be found at *inet:tls:handshake*.

Properties:

name	type	doc
:time	*time*	The time the handshake was initiated.
:flow	*inet:flow*	The raw inet:flow associated with the handshake.
:server	*inet:server*	The TLS server during the handshake.
:server:cert	*crypto:x509:cei*	The x509 certificate sent by the server during the handshake.
:server:fingerprint:]	*hash:md5*	The JA3S finger of the server.
:client	*inet:client*	The TLS client during the handshake.
:client:cert	*crypto:x509:cei*	The x509 certificate sent by the client during the handshake.
:client:fingerprint:]	*hash:md5*	The JA3 fingerprint of the client.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:tunnel

A specific sequence of hosts forwarding connections such as a VPN or proxy.

The base type for the form can be found at *inet:tunnel*.

Properties:

name	type	doc
:anon	*bool*	Indicates that this tunnel provides anonymization.
:type	*inet:tunnel:type:taxonomy*	The type of tunnel such as vpn or proxy.
:ingress	*inet:server*	The server where client traffic enters the tunnel.
:egress	*inet:server*	The server where client traffic leaves the tunnel.
:operator	*ps:contact*	The contact information for the tunnel operator.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node

risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:tunnel:type:taxonomy

A taxonomy of network tunnel types.

The base type for the form can be found at *inet:tunnel:type:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*inet:tunnel:type:taxono*	The taxonomy parent.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:url

A Universal Resource Locator (URL).

The base type for the form can be found at *inet:url*.

An example of `inet:url`:

- `http://www.woot.com/files/index.html`

  Properties:

name	type	doc	opts
:fqdn	*inet:fqdn*	The fqdn used in the URL (e.g., http://www.woot.com/page.html).	Read Only: True
:ipv4	*inet:ipv4*	The IPv4 address used in the URL (e.g., http://1.2.3.4/page.html).	Read Only: True
:ipv6	*inet:ipv6*	The IPv6 address used in the URL.	Read Only: True
:passwd	*inet:passwd*	The optional password used to access the URL.	Read Only: True
:base	*str*	The base scheme, user/pass, fqdn, port and path w/o parameters.	Read Only: True
:path	*str*	The path in the URL w/o parameters.	Read Only: True
:params	*str*	The URL parameter string.	Read Only: True
:port	*inet:port*	The port of the URL. URLs prefixed with http will be set to port 80 and URLs prefixed with https will be set to port 443 unless otherwise specified.	Read Only: True
:proto	*str* lower: True	The protocol in the URL.	Read Only: True
:user	*inet:user*	The optional username used to access the URL.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:url:mirror

A URL mirror site.

The base type for the form can be found at *inet:url:mirror*.

Properties:

name	type	doc	opts
:of	*inet:url*	The URL being mirrored.	Read Only: True
:at	*inet:url*	The URL of the mirror.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:urlfile

A file hosted at a specific Universal Resource Locator (URL).

The base type for the form can be found at *inet:urlfile*.

Properties:

name	type	doc	opts
:url	*inet:url*	The URL where the file was hosted.	Read Only: True
:file	*file:bytes*	The file that was hosted at the URL.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.

source	verb	target	doc
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:urlredir

A URL that redirects to another URL, such as via a URL shortening service or an HTTP 302 response.

The base type for the form can be found at *inet:urlredir*.

An example of `inet:urlredir`:

- `(http://foo.com/,http://bar.com/)`

Properties:

name	type	doc	opts
:src	*inet:url*	The original/source URL before redirect.	Read Only: True
:src:fqdn	*inet:fqdn*	The FQDN within the src URL (if present).	Read Only: True
:dst	*inet:url*	The redirected/destination URL.	Read Only: True
:dst:fqdn	*inet:fqdn*	The FQDN within the dst URL (if present).	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.

Table 177 – continued from previous page

source	verb	target	doc
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:user

A username string.

The base type for the form can be found at *inet:user*.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

inet:web:acct

An account with a given Internet-based site or service.

The base type for the form can be found at *inet:web:acct*.

An example of `inet:web:acct`:

- `twitter.com/invisig0th`

  Properties:

name	type	doc	opts
:avatar	*file:bytes*	The file representing the avatar (e.g., profile picture) for the account.	
:banner	*file:bytes*	The file representing the banner for the account.	
:dob	*time*	A self-declared date of birth for the account (if the account belongs to a person).	
:email	*inet:email*	The email address associated with the account.	
:linked:accts	*array* type: *inet:web:acct* uniq: `True` sorted: `True`	Linked accounts specified in the account profile.	
:latlong	*geo:latlong*	The last known latitude/longitude for the node.	
:place	*geo:place*	The geo:place associated with the latlong property.	
:loc	*loc*	A self-declared location for the account.	
:name	*inet:user*	The localized name associated with the account (may be different from the account identifier, e.g., a display name).	
:name:en	*inet:user*	The English version of the name associated with the (may be different from the account identifier, e.g., a display name).	Deprecated: `True`
:aliases	*array* type: *inet:user* uniq: `True` sorted: `True`	An array of alternate names for the user.	
:occupation	*str* lower: `True`	A self-declared occupation for the account.	
:passwd	*inet:passwd*	The current pass-	

Source Edges:

ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:web:action

An instance of an account performing an action at an Internet-based site or service.

The base type for the form can be found at *inet:web:action*.

Properties:

name	type	doc
:act	*str* lower: True strip: True	The action performed by the account.
:acct	*inet:web:acct*	The web account associated with the action.
:acct:site	*inet:fqdn*	The site or service associated with the account.
:acct:user	*inet:user*	The unique identifier for the account.
:time	*time*	The date and time the account performed the action.
:client	*inet:client*	The source client address of the action.
:client:ipv4	*inet:ipv4*	The source IPv4 address of the action.
:client:ipv6	*inet:ipv6*	The source IPv6 address of the action.
:loc	*loc*	The location of the user executing the web action.
:latlong	*geo:latlong*	The latlong of the user when executing the web action.
:place	*geo:place*	The geo:place of the user when executing the web action.

Source Edges:

sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:web:attachment

An instance of a file being sent to a web service by an account.

The base type for the form can be found at *inet:web:attachment*.

Properties:

name	type	doc	opts
:acct	*inet:web:acct*	The account that uploaded the file.	
:post	*inet:web:post*	The optional web post that the file was attached to.	
:mesg	*inet:web:mes*	The optional web message that the file was attached to.	
:proto	*inet:proto*	The protocol used to transmit the file to the web service.	Example: `https`
:interactiv	*bool*	Set to true if the upload was interactive. False if automated.	
:file	*file:bytes*	The file that was sent.	
:name	*file:path*	The name of the file at the time it was sent.	
:time	*time*	The time the file was sent.	
:client	*inet:client*	The client address which initiated the upload.	
:client:ipv	*inet:ipv4*	The IPv4 address of the client that initiated the upload.	
:client:ipv	*inet:ipv6*	The IPv6 address of the client that initiated the upload.	
:place	*geo:place*	The place the file was sent from.	
:place:loc	*loc*	The geopolitical location that the file was sent from.	
:place:name	*geo:name*	The reported name of the place that the file was sent from.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.

`risk:attack`	`-(uses)>`	*	The attack used the target node to facilitate the attack.
`risk:compromise`	`-(stole)>`	*	The target node was stolen or copied as a result of the compromise
`risk:extortion`	`-(leveraged)>`	*	The extortion event was based on attacker access to the target node
`risk:leak`	`-(leaked)>`	*	The leak included the disclosure of the target node.
`risk:threat`	`-(targets)>`	*	The threat cluster targeted the target node.
`risk:threat`	`-(uses)>`	*	The threat cluster uses the target node.
`risk:tool:software`	`-(uses)>`	*	The tool uses the target node.
`sci:evidence`	`-(has)>`	*	The evidence includes observations from the target nodes.
`sci:experiment`	`-(uses)>`	*	The experiment used the target nodes when it was run.
`sci:observation`	`-(has)>`	*	The observations are summarized from the target nodes.

inet:web:channel

A channel within a web service or instance such as slack or discord.

The base type for the form can be found at *inet:web:channel*.

Properties:

name	type	doc	opts
:url	*inet:url*	The primary URL used to identify the channel.	Example: `https://app.slack.com/client/T2XK1223Y/C2XHHNDS7`
:id	*str* strip: `True`	The operator specified ID of this channel.	Example: `C2XHHNDS7`
:instance	*inet:web:instance*	The instance which contains the channel.	
:name	*str* strip: `True`	The visible name of the channel.	Example: `general`
:topic	*str* strip: `True`	The visible topic of the channel.	Example: `Synapse Discussion - Feel free to invite others!`
:created	*time*	The time the channel was created.	
:creator	*inet:web:acct*	The account which created the channel.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.

Table 182 – continued from previous page

source	verb	target	doc
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:web:chprofile

A change to a web account. Used to capture historical properties associated with an account, as opposed to current data in the inet:web:acct node.

The base type for the form can be found at *inet:web:chprofile*.

Properties:

name	type	doc
:acct	*inet:wel*	The web account associated with the change.
:acct:s	*inet:fqd*	The site or service associated with the account.
:acct:u	*inet:use*	The unique identifier for the account.
:client	*inet:clie*	The source address used to make the account change.
:client	*inet:ipv*	The source IPv4 address used to make the account change.
:client	*inet:ipv*	The source IPv6 address used to make the account change.
:time	*time*	The date and time when the account change occurred.
:pv	*node-prop*	The prop=valu of the account property that was changed. Valu should be the old / original value, while the new value should be updated on the inet:web:acct form.
:pv:prc	*str*	The property that was changed.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc

econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:web:file

A file posted by a web account.

The base type for the form can be found at *inet:web:file*.

Properties:

name	type	doc	opts
:acct	*inet:web:acc*	The account that owns or is associated with the file.	Read Only: True
:acct:site	*inet:fqdn*	The site or service associated with the account.	Read Only: True
:acct:user	*inet:user*	The unique identifier for the account.	Read Only: True
:file	*file:bytes*	The file owned by or associated with the account.	Read Only: True
:name	*file:base*	The name of the file owned by or associated with the account.	
:posted	*time*	Deprecated. Instance data belongs on inet:web:attachment.	Deprecated: True
:client	*inet:client*	Deprecated. Instance data belongs on inet:web:attachment.	Deprecated: True
:client:ipv	*inet:ipv4*	Deprecated. Instance data belongs on inet:web:attachment.	Deprecated: True
:client:ipv	*inet:ipv6*	Deprecated. Instance data belongs on inet:web:attachment.	Deprecated: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:web:group

A group hosted within or registered with a given Internet-based site or service.

The base type for the form can be found at *inet:web:group*.

An example of `inet:web:group`:

- `somesite.com/mycoolgroup`

  Properties:

name	type	doc	opts
:site	*inet:fqdn*	The site or service associated with the group.	Read Only: True
:id	*inet:group*	The site-specific unique identifier for the group (may be different from the common name or display name).	Read Only: True
:name	*inet:group*	The localized name associated with the group (may be different from the account identifier, e.g., a display name).	
:aliases	*array* type: *inet:group* uniq: True sorted: True	An array of alternate names for the group.	
:name:en	*inet:group*	The English version of the name associated with the group (may be different from the localized name).	Deprecated: True
:url	*inet:url*	The service provider URL where the group is hosted.	
:avatar	*file:bytes*	The file representing the avatar (e.g., profile picture) for the group.	
:desc	*str*	The text of the description of the group.	
:webpage	*inet:url*	A related URL specified by the group (e.g., primary web site, etc.).	
:loc	*str* lower: True	A self-declared location for the group.	
:latlong	*geo:latlong*	The last known latitude/longitude for the node.	
:place	*geo:place*	The geo:place associated with the latlong property.	
:signup	*time*	The date and time the group was cre-

it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:web:hashtag

A hashtag used in a web post.

The base type for the form can be found at *inet:web:hashtag*.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc

it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:web:instance

An instance of a web service such as slack or discord.

The base type for the form can be found at *inet:web:instance*.

Properties:

name	type	doc	opts
:url	*inet:url*	The primary URL used to identify the instance.	Example: `https://app.slack.com/client/T2XK1223Y`
:id	*str* strip: `True`	The operator specified ID of this instance.	Example: `T2XK1223Y`
:name	*str* strip: `True`	The visible name of the instance.	Example: `vertex synapse`
:created	*time*	The time the instance was created.	
:creator	*inet:web:acct*	The account which created the instance.	
:owner	*ou:org*	The organization which created the instance.	
:owner:fqdn	*inet:fqdn*	The FQDN of the organization which created the instance. Used for entity resolution.	Example: `vertex.link`
:owner:name	*ou:name*	The name of the organization which created the instance. Used for entity resolution.	Example: `the vertex project, llc.`
:operator	*ou:org*	The organization which operates the instance.	
:operator:name	*ou:name*	The name of the organization which operates the instance. Used for entity resolution.	Example: `slack`
:operator:fqdn	*inet:fqdn*	The FQDN of the organization which operates the instance. Used for entity resolution.	Example: `slack.com`

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:web:logon

An instance of an account authenticating to an Internet-based site or service.

The base type for the form can be found at *inet:web:logon*.

Properties:

name	type	doc
:acct	*inet:web:acct*	The web account associated with the logon event.
:acct:site	*inet:fqdn*	The site or service associated with the account.
:acct:user	*inet:user*	The unique identifier for the account.
:time	*time*	The date and time the account logged into the service.
:client	*inet:client*	The source address of the logon.
:client:ipv4	*inet:ipv4*	The source IPv4 address of the logon.
:client:ipv6	*inet:ipv6*	The source IPv6 address of the logon.
:logout	*time*	The date and time the account logged out of the service.
:loc	*loc*	The location of the user executing the logon.
:latlong	*geo:latlong*	The latlong of the user executing the logon.
:place	*geo:place*	The geo:place of the user executing the logon.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.

inet:web:mesg

A message sent from one web account to another web account or channel.

The base type for the form can be found at *inet:web:mesg*.

An example of `inet:web:mesg`:

- `((twitter.com, invisig0th), (twitter.com, gobbles), 20041012130220)`

Properties:

name	type	doc	opts
`:from`	*inet:web:a*	The web account that sent the message.	Read Only: `True`
`:to`	*inet:web:a*	The web account that received the message.	Read Only: `True`
`:client`	*inet:client*	The source address of the message.	
`:client`	*inet:ipv4*	The source IPv4 address of the message.	
`:client`	*inet:ipv6*	The source IPv6 address of the message.	
`:time`	*time*	The date and time at which the message was sent.	Read Only: `True`
`:url`	*inet:url*	The URL where the message is posted / visible.	
`:text`	*str*	The text of the message.	Display: `{'hint': 'text'}`
`:delete`	*bool*	The message was deleted.	
`:file`	*file:bytes*	The file attached to or sent with the message.	
`:place`	*geo:place*	The place that the message was reportedly sent from.	
`:place:`	*geo:name*	The name of the place that the message was reportedly sent from. Used for entity resolution.	
`:instan`	*inet:web:i*	The instance where the message was sent.	

Source Edges:

source	verb	target	doc
`*`	`-(meets)>`	`ou:requireme`	The requirement is met by the source node.
`*`	`-(refs)>`	`*`	The source node contains a reference to the target node.
`*`	`-(seenat)`	`geo:telem`	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
`*`	`-(refs)>`	`*`	None
`econ:purchase`	`-(acquired)>`	`*`	The purchase was used to acquire the target node.
`it:app:snort:rule`	`-(detects)>`	`*`	The snort rule is intended for use in detecting the target node.

risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:web:post

A post made by a web account.

The base type for the form can be found at *inet:web:post*.

Properties:

name	type	doc	opts
`:acct`	*inet:web:acct*	The web account that made the post.	
`:acct:site`	*inet:fqdn*	The site or service associated with the account.	
`:client`	*inet:client*	The source address of the post.	
`:client:ipv4`	*inet:ipv4*	The source IPv4 address of the post.	
`:client:ipv6`	*inet:ipv6*	The source IPv6 address of the post.	
`:acct:user`	*inet:user*	The unique identifier for the account.	
`:text`	*str*	The text of the post.	Display: `{'hint': 'text'}`
`:time`	*time*	The date and time that the post was made.	
`:deleted`	*bool*	The message was deleted by the poster.	
`:url`	*inet:url*	The URL where the post is published / visible.	
`:file`	*file:bytes*	The file that was attached to the post.	
`:replyto`	*inet:web:post*	The post that this post is in reply to.	
`:repost`	*inet:web:post*	The original post that this is a repost of.	
`:hashtags`	*array* type: *inet:web:hashtag* uniq: `True` sorted: `True` split: `,`	Hashtags mentioned within the post.	
`:mentions:users`	*array* type: *inet:web:acct* uniq: `True` sorted: `True` split: `,`	Accounts mentioned within the post.	
`:mentions:groups`	*array* type: *inet:web:group* uniq: `True` sorted: `True` split: `,`	Groups mentioned within the post.	
`:loc`	*loc*	The location that the post was reportedly sent from.	
`:place`	*geo:place*	The place that the post was reportedly sent

inet:whois:contact

An individual contact from a domain whois record.

The base type for the form can be found at *inet:whois:contact*.

Properties:

name	type	doc	opts
:rec	*inet:whois:rec*	The whois record containing the contact data.	Read Only: True
:rec:fqdn	*inet:fqdn*	The domain associated with the whois record.	Read Only: True
:rec:asof	*time*	The date of the whois record.	Read Only: True
:type	*str* lower: True	The contact type (e.g., registrar, registrant, admin, billing, tech, etc.).	Read Only: True
:id	*str* lower: True	The ID associated with the contact.	
:name	*str* lower: True	The name of the contact.	
:email	*inet:email*	The email address of the contact.	
:orgname	*ou:name*	The name of the contact organization.	
:address	*str* lower: True	The content of the street address field(s) of the contact.	
:city	*str* lower: True	The content of the city field of the contact.	
:state	*str* lower: True	The content of the state field of the contact.	
:country	*str* lower: True	The two-letter country code of the contact.	
:phone	*tel:phone*	The content of the phone field of the contact.	
:fax	*tel:phone*	The content of the fax field of the contact.	
:url	*inet:url*	The URL specified for the contact.	
:whois:fqdn	*inet:fqdn*	The whois server FQDN for the given contact (most likely a registrar).	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.

Table 196 – continued from previous page

source	verb	target	doc
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:whois:ipcontact

An individual contact from an IP block record.

The base type for the form can be found at *inet:whois:ipcontact*.

Properties:

name	type	doc
:contact	*ps:contact*	Contact information associated with a registration.
:asof	*time*	The date of the record.
:created	*time*	The "created" time from the record.
:updated	*time*	The "last updated" time from the record.
:role	*str* lower: True	The primary role for the contact.
:roles	*array* type: *str* uniq: True sorted: True	Additional roles assigned to the contact.
:asn	*inet:asn*	The associated Autonomous System Number (ASN).
:id	*inet:whois:regid*	The registry unique identifier (e.g. NET-74-0-0-0-1).
:links	*array* type: *inet:url* uniq: True sorted: True	URLs provided with the record.
:status	*str* lower: True	The state of the registered contact (e.g. validated, obscured).
:contacts	*array* type: *inet:whois:ipcontact* uniq: True sorted: True	Additional contacts referenced by this contact.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:whois:ipquery

Query details used to retrieve an IP record.

The base type for the form can be found at *inet:whois:ipquery*.

Properties:

name	type	doc
:time	*time*	The time the request was made.
:url	*inet:url*	The query URL when using the HTTP RDAP Protocol.
:fqdn	*inet:fqdn*	The FQDN of the host server when using the legacy WHOIS Protocol.
:ipv4	*inet:ipv4*	The IPv4 address queried.
:ipv6	*inet:ipv6*	The IPv6 address queried.
:success	*bool*	Whether the host returned a valid response for the query.
:rec	*inet:whois:iprec*	The resulting record from the query.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:whois:iprec

An IPv4/IPv6 block registration record.

The base type for the form can be found at *inet:whois:iprec*.

Properties:

name	type	doc	opts
`:net4`	*inet:net4*	The IPv4 address range assigned.	
`:net4:min`	*inet:ipv4*	The first IPv4 in the range assigned.	
`:net4:max`	*inet:ipv4*	The last IPv4 in the range assigned.	
`:net6`	*inet:net6*	The IPv6 address range assigned.	
`:net6:min`	*inet:ipv6*	The first IPv6 in the range assigned.	
`:net6:max`	*inet:ipv6*	The last IPv6 in the range assigned.	
`:asof`	*time*	The date of the record.	
`:created`	*time*	The “created” time from the record.	
`:updated`	*time*	The “last updated” time from the record.	
`:text`	*str* lower: `True`	The full text of the record.	Display: `{'hint': 'text'}`
`:desc`	*str* lower: `True`	Notes concerning the record.	Display: `{'hint': 'text'}`
`:asn`	*inet:asn*	The associated Autonomous System Number (ASN).	
`:id`	*inet:whois:regid*	The registry unique identifier (e.g. NET-74-0-0-0-1).	
`:name`	*str*	The name assigned to the network by the registrant.	
`:parentid`	*inet:whois:regid*	The registry unique identifier of the parent whois record (e.g. NET-74-0-0-0-0).	
`:registrant`	*inet:whois:ipcontact*	Deprecated. Add the registrant inet:whois:ipcontact to the :contacts array.	Deprecated: `True`
`:contacts`	*array* type: *inet:whois:ipcontact* uniq: `True` sorted: `True`	Additional contacts from the record.	
`:country`	*str* lower: `True` regex: `^[a-z]{2}$`	The two-letter ISO 3166 country code.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.

source	verb	target	doc
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:wifi:ap

An SSID/MAC address combination for a wireless access point.

The base type for the form can be found at *inet:wifi:ap*.

Properties:

name	type	doc	opts
:ssid	*inet:wifi:ssid*	The SSID for the wireless access point.	Read Only: True
:bssid	*inet:mac*	The MAC address for the wireless access point.	Read Only: True
:latlong	*geo:latlong*	The best known latitude/longitude for the wireless access point.	
:accuracy	*geo:dist*	The reported accuracy of the latlong telemetry reading.	
:channel	*int*	The WIFI channel that the AP was last observed operating on.	
:encryption	*str* lower: True strip: True	The type of encryption used by the WIFI AP such as “wpa2”.	
:place	*geo:place*	The geo:place associated with the latlong property.	
:loc	*loc*	The geo-political location string for the wireless access point.	
:org	*ou:org*	The organization that owns/operates the access point.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

inet:wifi:ssid

A WiFi service set identifier (SSID) name.

The base type for the form can be found at *inet:wifi:ssid*.

An example of `inet:wifi:ssid`:

- `The Vertex Project`

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc

Table 207 – continued from previous page

source	verb	target	doc
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:account

A GUID that represents an account on a host or network.

The base type for the form can be found at *it:account*.

Properties:

name	type	doc	opts
:user	*inet:user*	The username associated with the account.	
:contact	*ps:contact*	Additional contact information associated with this account.	
:host	*it:host*	The host where the account is registered.	
:domain	*it:domain*	The authentication domain where the account is registered.	
:posix:uid	*int*	The user ID of the account.	Example: `1001`
:posix:gid	*int*	The primary group ID of the account.	Example: `1001`
:posix:gecos	*int*	The GECOS field for the POSIX account.	
:posix:home	*file:path*	The path to the POSIX account's home directory.	Example: `/home/visi`
:posix:shell	*file:path*	The path to the POSIX account's default shell.	Example: `/bin/bash`
:windows:sid	*it:os:windows:sid*	The Microsoft Windows Security Identifier of the account.	
:groups	*array* type: *it:group* uniq: `True` sorted: `True`	An array of groups that the account is a member of.	

Source Edges:

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:app:snort:hit

An instance of a snort rule hit.

The base type for the form can be found at *it:app:snort:hit*.

Properties:

name	type	doc
:rule	*it:app:snort:rule*	The snort rule that matched the file.
:flow	*inet:flow*	The inet:flow that matched the snort rule.
:src	*inet:addr*	The source address of flow that caused the hit.
:src:ipv4	*inet:ipv4*	The source IPv4 address of the flow that caused the hit.
:src:ipv6	*inet:ipv6*	The source IPv6 address of the flow that caused the hit.
:src:port	*inet:port*	The source port of the flow that caused the hit.
:dst	*inet:addr*	The destination address of the trigger.
:dst:ipv4	*inet:ipv4*	The destination IPv4 address of the flow that caused the hit.
:dst:ipv6	*inet:ipv6*	The destination IPv4 address of the flow that caused the hit.
:dst:port	*inet:port*	The destination port of the flow that caused the hit.
:time	*time*	The time of the network flow that caused the hit.
:sensor	*it:host*	The sensor host node that produced the hit.
:version	*it:semver*	The version of the rule at the time of match.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

it:app:snort:rule

A snort rule.

The base type for the form can be found at *it:app:snort:rule*.

Properties:

name	type	doc	opts
:id	*str*	The snort rule id.	
:text	*str*	The snort rule text.	Display: {'hint': 'text'}
:name	*str*	The name of the snort rule.	
:desc	*str*	A brief description of the snort rule.	Display: {'hint': 'text'}
:engine	*int*	The snort engine ID which can parse and evaluate the rule text.	
:versio	*it:semver*	The current version of the rule.	
:author	*ps:contact*	Contact info for the author of the rule.	
:create	*time*	The time the rule was initially created.	
:update	*time*	The time the rule was most recently modified.	
:enable	*bool*	The rule enabled status to be used for snort evaluation engines.	
:family	*it:prod:softna*	The name of the software family the rule is designed to detect.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:app:yara:match

A YARA rule match to a file.

The base type for the form can be found at *it:app:yara:match*.

Properties:

name	type	doc	opts
:rule	*it:app:yara:rule*	The YARA rule that matched the file.	Read Only: True
:file	*file:bytes*	The file that matched the YARA rule.	Read Only: True
:version	*it:semver*	The most recent version of the rule evaluated as a match.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc

it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:app:yara:procmatch

An instance of a YARA rule match to a process.

The base type for the form can be found at *it:app:yara:procmatch*.

Properties:

name	type	doc
:rule	*it:app:yara:rule*	The YARA rule that matched the file.
:proc	*it:exec:proc*	The process that matched the YARA rule.
:time	*time*	The time that the YARA engine matched the process to the rule.
:version	*it:semver*	The most recent version of the rule evaluated as a match.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.

Table 213 – continued from previous page

source	verb	target	doc
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:app:yara:rule

A YARA rule unique identifier.

The base type for the form can be found at *it:app:yara:rule*.

Properties:

name	type	doc	opts
:text	*str*	The YARA rule text.	Display: {'hint': 'text', 'syntax': 'yara'}
:ext:i	*str*	The YARA rule ID from an external system.	
:url	*inet:url*	A URL which documents the YARA rule.	
:name	*str*	The name of the YARA rule.	
:autho	*ps:contact*	Contact info for the author of the YARA rule.	
:versi	*it:semver*	The current version of the rule.	
:creat	*time*	The time the YARA rule was initially created.	
:updat	*time*	The time the YARA rule was most recently modified.	
:enabl	*bool*	The rule enabled status to be used for YARA evaluation engines.	
:famil	*it:prod:soft*	The name of the software family the rule is designed to detect.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.
it:app:yara:r	-(detects)	*	The YARA rule is intended for use in detecting the target node.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:auth:passwdhash

An instance of a password hash.

The base type for the form can be found at *it:auth:passwdhash*.

Properties:

name	type	doc
:salt	*hex*	The (optional) hex encoded salt value used to calculate the password hash.
:hash:md5	*hash:md5*	The MD5 password hash value.
:hash:sha1	*hash:sha1*	The SHA1 password hash value.
:hash:sha256	*hash:sha256*	The SHA256 password hash value.
:hash:sha512	*hash:sha512*	The SHA512 password hash value.
:hash:lm	*hash:lm*	The LM password hash value.
:hash:ntlm	*hash:ntlm*	The NTLM password hash value.
:passwd	*inet:passwd*	The (optional) clear text password for this password hash.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:av:filehit

Deprecated. Please use it:av:scan:result.

The base type for the form can be found at *it:av:filehit*.

Properties:

name	type	doc	opts
:file	*file:bytes*	The file that triggered the signature hit.	Read Only: True
:sig	*it:av:sig*	The signature that the file triggered on.	Read Only: True
:sig:name	*it:av:signame*	The signature name.	Read Only: True
:sig:soft	*it:prod:soft*	The anti-virus product which contains the signature.	Read Only: True

Source Edges:

source	verb	target	doc

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:av:scan:result

The result of running an antivirus scanner.

The base type for the form can be found at *it:av:scan:result*.

Properties:

name	type	doc
:time	*time*	The time the scan was run.
:verdict	*int* enums: ((10, 'benign'), (20, 'unknown'), (30, 'suspicious'), (40, 'malicious'))	The scanner provided verdict for the scan.
:scanner	*it:prod:softver*	The scanner software used to produce the result.
:scanner:name	*it:prod:softname*	The name of the scanner software.
:signame	*it:av:signame*	The name of the signature returned by the scanner.
:target:file	*file:bytes*	The file that was scanned to produce the result.
:target:proc	*it:exec:proc*	The process that was scanned to produce the result.
:target:host	*it:host*	The host that was scanned to produce the result.
:target:fqdn	*inet:fqdn*	The FQDN that was scanned to produce the result.
:target:url	*inet:url*	The URL that was scanned to produce the result.
:target:ipv4	*inet:ipv4*	The IPv4 address that was scanned to produce the result.
:target:ipv6	*inet:ipv6*	The IPv6 address that was scanned to produce the result.
:multi:scan	*it:av:scan:result*	Set if this result was part of running multiple scanners.
:multi:count	*int* min: 0	The total number of scanners which were run by a multi-scanner.
:multi:count:benign	*int* min: 0	The number of scanners which returned a benign verdict.
:multi:count:unknown	*int* min: 0	The number of scanners which returned a unknown/unsupported verdict.
:multi:count:suspicious	*int* min: 0	The number of scanners which returned a suspicious verdict.
:multi:count:malicious	*int* min: 0	The number of scanners which returned a malicious verdict.

ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.

continues on next page

Table 220 – continued from previous page

source	verb	target	doc
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:cmd

A unique command-line string.

The base type for the form can be found at *it:cmd*.

An example of `it:cmd`:

- `foo.exe --dostuff bar`

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.

risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:dev:repo

A version control system instance.

The base type for the form can be found at *it:dev:repo*.

Properties:

name	type	doc	opts
:name	*str* lower: `True` strip: `True`	The name of the repository.	
:desc	*str*	A free-form description of the repository.	Display: `{'hint': 'text'}`
:created	*time*	When the repository was created.	
:url	*inet:url*	A URL where the repository is hosted.	
:type	*it:dev:repo:type:taxono*	The type of the version control system used.	Example: `svn`
:submodules	*array* type: *it:dev:repo:commit*	An array of other repos that this repo has as submodules, pinned at specific commits.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc

risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:dev:repo:branch

A branch in a version control system instance.

The base type for the form can be found at *it:dev:repo:branch*.

Properties:

name	type	doc
:parent	*it:dev:repo:branch*	The branch this branch was branched from.
:start	*it:dev:repo:commit*	The commit in the parent branch this branch was created at.
:name	*str* strip: True	The name of the branch.
:url	*inet:url*	The URL where the branch is hosted.
:created	*time*	The time this branch was created.
:merged	*time*	The time this branch was merged back into its parent.
:deleted	*time*	The time this branch was deleted.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:dev:repo:commit

A commit to a repository.

The base type for the form can be found at *it:dev:repo:commit*.

Properties:

name	type	doc	opts
:repo	*it:dev:repo*	The repository the commit lives in.	
:parents	*array* type: *it:dev:repo:commit*	The commit or commits this commit is immediately based on.	
:branch	*it:dev:repo:branch*	The name of the branch the commit was made to.	
:mesg	*str*	The commit message describing the changes in the commit.	Display: {'hint': 'text'}
:id	*str*	The version control system specific commit identifier.	
:created	*time*	The time the commit was made.	
:url	*inet:url*	The URL where the commit is hosted.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.

Table 229 – continued from previous page

source	verb	target	doc
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:dev:repo:diff

A diff of a file being applied in a single commit.

The base type for the form can be found at *it:dev:repo:diff* .

Properties:

name	type	doc
:commit	*it:dev:repo:commit*	The commit that produced this diff.
:file	*file:bytes*	The file after the commit has been applied.
:path	*file:path*	The path to the file in the repo that the diff is being applied to.
:url	*inet:url*	The URL where the diff is hosted.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:dev:repo:diff:comment

A comment on a diff in a repository.

The base type for the form can be found at *it:dev:repo:diff:comment*.

Properties:

name	type	doc	opts
:diff	*it:dev:repo:diff*	The diff the comment is being added to.	
:text	*str*	The body of the comment.	Display: {'hint': 'text'}
:replyt	*it:dev:repo:diff:co*	The comment that this comment is replying to.	
:line	*int*	The line in the file that is being commented on.	
:offset	*int*	The offset in the line in the file that is being commented on.	
:url	*inet:url*	The URL where the comment is hosted.	
:create	*time*	The time the comment was created.	
:update	*time*	The time the comment was updated.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node

risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:dev:repo:issue

An issue raised in a repository.

The base type for the form can be found at *it:dev:repo:issue*.

Properties:

name	type	doc	opts
:repo	*it:dev:repo*	The repo where the issue was logged.	
:title	*str* lower: True strip: True	The title of the issue.	
:desc	*str*	The text describing the issue.	Display: {'hint': 'text'}
:created	*time*	The time the issue was created.	
:updated	*time*	The time the issue was updated.	
:url	*inet:url*	The URL where the issue is hosted.	
:id	*str* strip: True	The ID of the issue in the repository system.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:dev:repo:issue:comment

A comment on an issue in a repository.

The base type for the form can be found at *it:dev:repo:issue:comment*.

Properties:

name	type	doc	opts
:issue	*it:dev:repo:issue*	The issue thread that the comment was made in.	
:text	*str*	The body of the comment.	Display: {'hint': 'text'}
:replyt	*it:dev:repo:issue:com*	The comment that this comment is replying to.	
:url	*inet:url*	The URL where the comment is hosted.	
:create	*time*	The time the comment was created.	
:update	*time*	The time the comment was updated.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:dev:repo:type:taxonomy

A version control system type taxonomy.

The base type for the form can be found at *it:dev:repo:type:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*it:dev:repo:type:taxono*	The taxonomy parent.	Read Only: True

Source Edges:

ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:dev:str

A developer selected string.

The base type for the form can be found at *it:dev:str*.

Properties:

name	type	doc
:norm	*str* lower: True	Lower case normalized version of the it:dev:str.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.

source	verb	target	doc
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:domain

A logical boundary of authentication and configuration such as a windows domain.

The base type for the form can be found at *it:domain*.

Properties:

name	type	doc
:name	*str* lower: True onespace: True	The name of the domain.
:desc	*str*	A brief description of the domain.
:org	*ou:org*	The org that operates the given domain.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.

risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:exec:bind

An instance of a host binding a listening port.

The base type for the form can be found at *it:exec:bind*.

Properties:

name	type	doc
:proc	*it:exec:proc*	The host process which caused the activity.
:host	*it:host*	The host on which the activity occurred.
:exe	*file:bytes*	The executable file which caused the activity.
:time	*time*	The time that the activity started.
:server	*inet:server*	The inet:addr of the server when binding the port.
:server:ipv4	*inet:ipv4*	The IPv4 address specified to bind().
:server:ipv6	*inet:ipv6*	The IPv6 address specified to bind().
:server:port	*inet:port*	The bound (listening) TCP port.
:sandbox:file	*file:bytes*	The initial sample given to a sandbox environment to analyze.
:thread	*it:exec:thread*	The host thread which caused the activity.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:exec:file:add

An instance of a host adding a file to a filesystem.

The base type for the form can be found at *it:exec:file:add*.

Properties:

name	type	doc	opts
:proc	*it:exec:proc*	The host process which caused the activity.	
:host	*it:host*	The host on which the activity occurred.	
:exe	*file:bytes*	The executable file which caused the activity.	
:time	*time*	The time that the activity started.	
:path	*file:path*	The path where the file was created.	
:path:dir	*file:path*	The parent directory of the file path (parsed from :path).	Read Only: True
:path:ext	*str* lower: True strip: True	The file extension of the file name (parsed from :path).	Read Only: True
:path:base	*file:base*	The final component of the file path (parsed from :path).	Read Only: True
:file	*file:bytes*	The file that was created.	
:sandbox:file	*file:bytes*	The initial sample given to a sandbox environment to analyze.	
:thread	*it:exec:thread*	The host thread which caused the activity.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.

sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:exec:file:del

An instance of a host deleting a file from a filesystem.

The base type for the form can be found at *it:exec:file:del*.

Properties:

name	type	doc	opts
:proc	*it:exec:proc*	The host process which caused the activity.	
:host	*it:host*	The host on which the activity occurred.	
:exe	*file:bytes*	The executable file which caused the activity.	
:time	*time*	The time that the activity started.	
:path	*file:path*	The path where the file was deleted.	
:path:dir	*file:path*	The parent directory of the file path (parsed from :path).	Read Only: True
:path:ext	*str* lower: True strip: True	The file extension of the file name (parsed from :path).	Read Only: True
:path:base	*file:base*	The final component of the file path (parsed from :path).	Read Only: True
:file	*file:bytes*	The file that was deleted.	
:sandbox:file	*file:bytes*	The initial sample given to a sandbox environment to analyze.	
:thread	*it:exec:thread*	The host thread which caused the activity.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

it:exec:loadlib

A library load event in a process.

The base type for the form can be found at *it:exec:loadlib*.

Properties:

name	type	doc
:proc	*it:exec:proc*	The host process which caused the activity.
:va	*int*	The base memory address where the library was loaded in the process.
:loaded	*time*	The time the library was loaded.
:unloaded	*time*	The time the library was unloaded.
:path	*file:path*	The path that the library was loaded from.
:file	*file:bytes*	The library file that was loaded.
:sandbox:file	*file:bytes*	The initial sample given to a sandbox environment to analyze.
:exe	*file:bytes*	The executable file which caused the activity.
:thread	*it:exec:thread*	The host thread which caused the activity.
:host	*it:host*	The host on which the activity occurred.

*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:exec:mmap

A memory mapped segment located in a process.

The base type for the form can be found at *it:exec:mmap*.

Properties:

name	type	doc
:proc	*it:exec:proc*	The host process which caused the activity.
:va	*int*	The base memory address where the map was created in the process.
:size	*int*	The size of the memory map in bytes.
:perms:read	*bool*	True if the mmap is mapped with read permissions.
:perms:write	*bool*	True if the mmap is mapped with write permissions.
:perms:execu	*bool*	True if the mmap is mapped with execute permissions.
:created	*time*	The time the memory map was created.
:deleted	*time*	The time the memory map was deleted.
:path	*file:path*	The file path if the mmap is a mapped view of a file.
:hash:sha256	*hash:sha256*	A SHA256 hash of the memory map. Bytes may optionally be present in the axon.
:sandbox:fil	*file:bytes*	The initial sample given to a sandbox environment to analyze.
:exe	*file:bytes*	The executable file which caused the activity.
:thread	*it:exec:threa*	The host thread which caused the activity.
:host	*it:host*	The host on which the activity occurred.
:time	*time*	The time that the activity started.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:exec:proc

A process executing on a host. May be an actual (e.g., endpoint) or virtual (e.g., malware sandbox) host.

The base type for the form can be found at *it:exec:proc*.

Properties:

name	type	doc	opts
:host	*it:host*	The host on which the activity occurred.	
:exe	*file:bytes*	The executable file which caused the activity.	
:cmd	*it:cmd*	The command string used to launch the process, including any command line parameters.	Display: {'hint': 'text'}
:pid	*int*	The process ID.	
:time	*time*	The time that the activity started.	
:name	*str*	The display name specified by the process.	
:exited	*time*	The time the process exited.	
:exitcode	*int*	The exit code for the process.	
:user	*inet:user*	The user name of the process owner.	Deprecated: True
:account	*it:accoun*	The account of the process owner.	
:path	*file:path*	The path to the executable of the process.	
:path:bas	*file:base*	The file basename of the executable of the process.	
:src:exe	*file:path*	Deprecated. Create :src:proc and set :path.	Deprecated: True
:src:proc	*it:exec:pr*	The process which created the process.	
:killedby	*it:exec:pr*	The process which killed this process.	
:sandbox:	*file:bytes*	The initial sample given to a sandbox environment to analyze.	
:proc	*it:exec:pr*	The host process which caused the activity.	
:thread	*it:exec:th*	The host thread which caused the activity.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc

sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:exec:query

An instance of an executed query.

The base type for the form can be found at *it:exec:query*.

Properties:

name	type	doc
:text	*it:query*	The query string that was executed.
:opts	*data*	An opaque JSON object containing query parameters and options.
:api:url	*inet:url*	The URL of the API endpoint the query was sent to.
:language	*str* lower: True onespace: True	The name of the language that the query is expressed in.
:offset	*int*	The offset of the last record consumed from the query.
:exe	*file:bytes*	The executable file which caused the activity.
:proc	*it:exec:proc*	The host process which caused the activity.
:thread	*it:exec:thread*	The host thread which caused the activity.
:host	*it:host*	The host on which the activity occurred.
:time	*time*	The time that the activity started.
:sandbox:file	*file:bytes*	The initial sample given to a sandbox environment to analyze.

Source Edges:

source	verb	target	doc

risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:exec:reg:set

An instance of a host creating or setting a registry key.

The base type for the form can be found at *it:exec:reg:set*.

Properties:

name	type	doc
:proc	*it:exec:proc*	The host process which caused the activity.
:host	*it:host*	The host on which the activity occurred.
:exe	*file:bytes*	The executable file which caused the activity.
:time	*time*	The time that the activity started.
:reg	*it:dev:regval*	The registry key or value that was written to.
:sandbox:file	*file:bytes*	The initial sample given to a sandbox environment to analyze.
:thread	*it:exec:thread*	The host thread which caused the activity.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.

Table 253 – continued from previous page

source	verb	target	doc
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:exec:thread

A thread executing in a process.

The base type for the form can be found at *it:exec:thread*.

Properties:

name	type	doc
:proc	*it:exec:proc*	The host process which caused the activity.
:created	*time*	The time the thread was created.
:exited	*time*	The time the thread exited.
:exitcode	*int*	The exit code or return value for the thread.
:src:proc	*it:exec:proc*	An external process which created the thread.
:src:thread	*it:exec:thread*	The thread which created this thread.
:sandbox:file	*file:bytes*	The initial sample given to a sandbox environment to analyze.
:exe	*file:bytes*	The executable file which caused the activity.
:thread	*it:exec:thread*	The host thread which caused the activity.
:host	*it:host*	The host on which the activity occurred.
:time	*time*	The time that the activity started.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:exec:url

An instance of a host requesting a URL.

The base type for the form can be found at *it:exec:url*.

Properties:

name	type	doc
:proc	*it:exec:proc*	The host process which caused the activity.
:browser	*it:prod:softver*	The software version of the browser.
:host	*it:host*	The host on which the activity occurred.
:exe	*file:bytes*	The executable file which caused the activity.
:time	*time*	The time that the activity started.
:url	*inet:url*	The URL that was requested.
:page:pdf	*file:bytes*	The rendered DOM saved as a PDF file.
:page:html	*file:bytes*	The rendered DOM saved as an HTML file.
:page:image	*file:bytes*	The rendered DOM saved as an image.
:http:request	*inet:http:request*	The HTTP request made to retrieve the initial URL contents.
:client	*inet:client*	The address of the client during the URL retrieval.
:client:ipv4	*inet:ipv4*	The IPv4 of the client during the URL retrieval.
:client:ipv6	*inet:ipv6*	The IPv6 of the client during the URL retrieval.
:client:port	*inet:port*	The client port during the URL retrieval.
:sandbox:file	*file:bytes*	The initial sample given to a sandbox environment to analyze.
:thread	*it:exec:thread*	The host thread which caused the activity.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.

sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:fs:file

A file on a host.

The base type for the form can be found at *it:fs:file*.

Properties:

name	type	doc	opts
:host	*it:host*	The host containing the file.	
:path	*file:path*	The path for the file.	
:path:dir	*file:path*	The parent directory of the file path (parsed from :path).	Read Only: True
:path:ext	*str* lower: True strip: True	The file extension of the file name (parsed from :path).	Read Only: True
:path:base	*file:base*	The final component of the file path (parsed from :path).	Read Only: True
:file	*file:bytes*	The file on the host.	
:ctime	*time*	The file creation time.	
:mtime	*time*	The file modification time.	
:atime	*time*	The file access time.	
:user	*inet:user*	The owner of the file.	
:group	*inet:user*	The group owner of the file.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:group

A GUID that represents a group on a host or network.

The base type for the form can be found at *it:group*.

Properties:

name	type	doc	opts
:name	*str* lower: `True` onespace: `True`	The name of the group.	
:desc	*str*	A brief description of the group.	
:host	*it:host*	The host where the group is registered.	
:domain	*it:domain*	The authentication domain where the group is registered.	
:groups	*array* type: *it:group* uniq: `True` sorted: `True`	Groups that are a member of this group.	
:posix:gid	*int*	The primary group ID of the account.	Example: `1001`
:windows:sid	*it:os:windows:sid*	The Microsoft Windows Security Identifier of the group.	

Source Edges:

sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:host

A GUID that represents a host or system.

The base type for the form can be found at *it:host*.

Properties:

name	type	doc	opts
:name	*it:hostname*	The name of the host or system.	
:desc	*str*	A free-form description of the host.	
:domain	*it:domain*	The authentication domain that the host is a member of.	
:ipv4	*inet:ipv4*	The last known ipv4 address for the host.	
:latlong	*geo:latlong*	The last known location for the host.	
:place	*geo:place*	The place where the host resides.	
:loc	*loc*	The geo-political location string for the node.	
:os	*it:prod:softver*	The operating system of the host.	
:os:name	*it:prod:softname*	A software product name for the host operating system. Used for entity resolution.	
:hardware	*it:prod:hardware*	The hardware specification for this host.	
:manu	*str*	Please use :hardware:make.	Deprecated: `True`
:model	*str*	Please use :hardware:model.	Deprecated: `True`
:serial	*str*	The serial number of the host.	
:operator	*ps:contact*	The operator of the host.	
:org	*ou:org*	The org that operates the given host.	
:ext:id	*str*	An external identifier for the host.	
:keyboard:layout	*str* lower: `True` onespace: `True`	The primary keyboard layout configured on the host.	
:keyboard:language	*lang:language*	The primary keyboard input language configured on the host.

ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node

source	verb	target	doc
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:hosturl

A url hosted on or served by a host or system.

The base type for the form can be found at *it:hosturl*.

Properties:

name	type	doc	opts
:host	*it:host*	Host serving a url.	Read Only: True
:url	*inet:url*	URL available on the host.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.

Table 261 – continued from previous page

source	verb	target	doc
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:log:event

A GUID representing an individual log event.

The base type for the form can be found at *it:log:event*.

Properties:

name	type	doc	opts
:mesg	*str*	The log message text.	
:type	*it:log:event:type:taxono*	A taxonometric type for the log event.	Example: `windows.eventlog.securitylog`
:severity	*int* enums: `((10, 'debug'), (20, 'info'), (30, 'notice'), (40, 'warning'), (50, 'err'), (60, 'crit'), (70, 'alert'), (80, 'emerg'))`	A log level integer that increases with severity.	
:data	*data*	A raw JSON record of the log event.	
:ext:id	*str*	An external id that uniquely identifies this log entry.	
:product	*it:prod:softver*	The software which produced the log entry.	
:exe	*file:bytes*	The executable file which caused the activity.	
:proc	*it:exec:proc*	The host process which caused the activity.	
:thread	*it:exec:thread*	The host thread which caused the activity.	
:host	*it:host*	The host on which the activity occurred.	
:time	*time*	The time that the activity started.	
:sandbox:file	*file:bytes*	The initial sample given to a sandbox environment to analyze.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:log:event:type:taxonomy

A taxonomy of log event types.

The base type for the form can be found at *it:log:event:type:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*it:log:event:type:taxonc*	The taxonomy parent.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None

sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:logon

A GUID that represents an individual logon/logoff event.

The base type for the form can be found at *it:logon*.

Properties:

name	type	doc
:time	*time*	The time the logon occurred.
:success	*bool*	Set to false to indicate an unsuccessful logon attempt.
:logoff:time	*time*	The time the logon session ended.
:host	*it:host*	The host that the account logged in to.
:account	*it:account*	The account that logged in.
:creds	*auth:creds*	The credentials that were used for the logon.
:duration	*duration*	The duration of the logon session.
:client:host	*it:host*	The host where the logon originated.
:client:ipv4	*inet:ipv4*	The IPv4 where the logon originated.
:client:ipv6	*inet:ipv6*	The IPv6 where the logon originated.

Source Edges:

source	verb	target	doc

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:mitre:attack:campaign

A MITRE ATT&CK Campaign ID.

The base type for the form can be found at *it:mitre:attack:campaign*.

An example of `it:mitre:attack:campaign`:

- `C0028`

Properties:

name	type	doc	opts
:name	*ou:campname*	The primary name for the ATT&CK campaign.	
:names	*array* type: *ou:campname* uniq: True sorted: True	An array of alternate names for the ATT&CK campaign.	
:desc	*str* strip: True	A description of the ATT&CK campaign.	Display: {'hint': 'text'}
:url	*inet:url*	The URL that documents the ATT&CK campaign.	
:groups	*array* type: *it:mitre:attack:group* uniq: True sorted: True split: ,	An array of ATT&CK group IDs attributed to the campaign.	
:software	*array* type: *it:mitre:attack:softwa* uniq: True sorted: True split: ,	An array of ATT&CK software IDs used in the campaign.	
:techniques	*array* type: *it:mitre:attack:techni* uniq: True sorted: True split: ,	An array of ATT&CK technique IDs used in the campaign.	
:matrices	*array* type: *it:mitre:attack:matri* uniq: True sorted: True split: ,	The ATT&CK matrices which define the campaign.	
:references	*array*	An array of URLs that document the	

Source Edges:

risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:mitre:attack:mitigation

A MITRE ATT&CK Mitigation ID.

The base type for the form can be found at *it:mitre:attack:mitigation*.

An example of `it:mitre:attack:mitigation`:

- `M1036`

Properties:

name	type	doc	opts
`:name`	*str* lower: `True` onespace: `True`	The primary name for the ATT&CK mitigation.	
`:matrix`	*it:mitre:attack:matri*	The ATT&CK matrix which defines the mitigation.	
`:desc`	*str* strip: `True`	A description of the ATT&CK mitigation.	Display: `{'hint': 'text'}`
`:url`	*inet:url*	The URL that documents the ATT&CK mitigation.	
`:tag`	*syn:tag*	Deprecated. Please use risk:mitigation:tag.	Deprecated: `True`
`:references`	*array* type: *inet:url* uniq: `True`	An array of URLs that document the ATT&CK mitigation.	
`:addresses`	*array* type: *it:mitre:attack:techn* uniq: `True` sorted: `True` split: `,`	An array of ATT&CK technique IDs addressed by the mitigation.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:mitre:attack:software

A MITRE ATT&CK Software ID.

The base type for the form can be found at *it:mitre:attack:software*.

An example of `it:mitre:attack:software`:

- `S0154`

  Properties:

name	type	doc	opts
:software	*it:prod:soft*	Used to map an ATT&CK software to a synapse it:prod:soft.	
:name	*it:prod:softname*	The primary name for the ATT&CK software.	
:names	*array* type: *it:prod:softname* uniq: `True` sorted: `True`	Associated names for the ATT&CK software.	
:desc	*str* strip: `True`	A description of the ATT&CK software.	Display: `{'hint': 'text'}`
:isnow	*it:mitre:attack:softw*	If deprecated, this field may contain the current value for the software.	
:url	*inet:url*	The URL that documents the ATT&CK software.	
:tag	*syn:tag*	Deprecated. Please use risk:tool:software:tag	Deprecated: `True`
:references	*array* type: *inet:url* uniq: `True`	An array of URLs that document the ATT&CK software.	
:techniques	*array* type: *it:mitre:attack:techni* uniq: `True` sorted: `True` split: `,`	An array of techniques used by the software.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:mitre:attack:tactic

A MITRE ATT&CK Tactic ID.

The base type for the form can be found at *it:mitre:attack:tactic*.

An example of `it:mitre:attack:tactic`:

- `TA0040`

Properties:

name	type	doc	opts
`:name`	*str* strip: `True`	The primary name for the ATT&CK tactic.	
`:matrix`	*it:mitre:attack:matri*	The ATT&CK matrix which defines the tactic.	
`:desc`	*str*	A description of the ATT&CK tactic.	Display: `{'hint': 'text'}`
`:url`	*inet:url*	The URL that documents the ATT&CK tactic.	
`:tag`	*syn:tag*	Deprecated.	Deprecated: `True`
`:references`	*array* type: *inet:url* uniq: `True`	An array of URLs that document the ATT&CK tactic.	

Source Edges:

source	verb	target	doc
`*`	`-(meets)>`	`ou:requireme`	The requirement is met by the source node.
`*`	`-(refs)>`	`*`	The source node contains a reference to the target node.
`*`	`-(seenat)`	`geo:telem`	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
`*`	`-(refs)>`	`*`	None
`econ:purchase`	`-(acquired)>`	`*`	The purchase was used to acquire the target node.
`it:app:snort:rule`	`-(detects)>`	`*`	The snort rule is intended for use in detecting the target node.
`it:app:yara:rule`	`-(detects)>`	`*`	The YARA rule is intended for use in detecting the target nod
`it:exec:query`	`-(found)>`	`*`	The target node was returned as a result of running the query.

meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:mitre:attack:technique

A MITRE ATT&CK Technique ID.

The base type for the form can be found at *it:mitre:attack:technique*.

An example of `it:mitre:attack:technique`:

- `T1548`

  Properties:

name	type	doc	opts
:name	*str* lower: True onespace: True	The primary name for the ATT&CK technique.	
:matrix	*it:mitre:attack:matri:*	The ATT&CK matrix which defines the technique.	
:status	*it:mitre:attack:status*	The status of this ATT&CK technique.	
:isnow	*it:mitre:attack:techni*	If deprecated, this field may contain the current value for the technique.	
:desc	*str* strip: True	A description of the ATT&CK technique.	Display: {'hint': 'text'}
:url	*inet:url*	The URL that documents the ATT&CK technique.	
:tag	*syn:tag*	Deprecated. Please use ou:technique:tag.	Deprecated: True
:references	*array* type: *inet:url* uniq: True	An array of URLs that document the ATT&CK technique.	
:parent	*it:mitre:attack:techni*	The parent ATT&CK technique on this sub-technique.	
:tactics	*array* type: *it:mitre:attack:tactic* uniq: True sorted: True split: ,	An array of ATT&CK tactics that include this technique.	

Source Edges:

risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:os:android:intent

An android intent string.

The base type for the form can be found at *it:os:android:intent*.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:os:android:perm

An android permission string.

The base type for the form can be found at *it:os:android:perm*.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:os:android:reqperm

The given software requests the android permission.

The base type for the form can be found at *it:os:android:reqperm*.

Properties:

name	type	doc	opts
:app	*it:prod:softver*	The android app which requests the permission.	Read Only: True
:perm	*it:os:android:perm*	The android permission requested by the app.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:prod:hardware

A specification for a piece of IT hardware.

The base type for the form can be found at *it:prod:hardware*.

Properties:

name	type	doc	opts
:name	*str* lower: True onespace: True	The display name for this hardware specification.	
:type	*it:prod:hardwaretype*	The type of hardware.	
:desc	*str*	A brief description of the hardware.	Display: {'hint': 'text'}
:cpe	*it:sec:cpe*	The NIST CPE 2.3 string specifying this hardware.	
:make	*ou:name*	The name of the organization which manufactures this hardware.	
:model	*str* lower: True onespace: True	The model name or number for this hardware specification.	
:version	*str* lower: True onespace: True	Version string associated with this hardware specification.	
:released	*time*	The initial release date for this hardware.	
:parts	*array* type: *it:prod:hardware* uniq: True sorted: True	An array of it:prod:hardware parts included in this hardware specification.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node

risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:prod:hardwaretype

An IT hardware type taxonomy.

The base type for the form can be found at *it:prod:hardwaretype*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*it:prod:hardwaretype*	The taxonomy parent.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

Table 284 – continued from previous page

source	verb	target	doc
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:prod:softfile

A file is distributed by a specific software version.

The base type for the form can be found at *it:prod:softfile*.

Properties:

name	type	doc	opts
:soft	*it:prod:softver*	The software which distributes the file.	Read Only: True
:file	*file:bytes*	The file distributed by the software.	Read Only: True
:path	*file:path*	The default installation path of the file.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.

risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:prod:softid

An identifier issued to a given host by a specific software application.

The base type for the form can be found at *it:prod:softid*.

Properties:

name	type	doc
:id	*str*	The ID issued by the software to the host.
:host	*it:host*	The host which was issued the ID by the software.
:soft	*it:prod:softver*	The software which issued the ID to the host.
:soft:name	*it:prod:softname*	The name of the software which issued the ID to the host.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node

it:prod:softver

A specific version of a software product.

The base type for the form can be found at *it:prod:softver*.

Properties:

name	type	doc	opts
:software	*it:prod:soft*	Software associated with this version instance.	
:software:name	*str* lower: True strip: True	Deprecated. Please use it:prod:softver:name.	Deprecated: True
:name	*it:prod:softname*	Name of the software version.	
:names	*array* type: *it:prod:softname* uniq: True sorted: True	Observed/variant names for this software version.	
:desc	*str*	A description of the software.	Display: {'hint': 'text'}
:cpe	*it:sec:cpe*	The NIST CPE 2.3 string specifying this software version.	
:cves	*array* type: *it:sec:cve* uniq: True sorted: True	A list of CVEs that apply to this software version.	
:vers	*it:dev:str*	Version string associated with this version instance.	
:vers:norm	*str* lower: True	Normalized version of the version string.	
:arch	*it:dev:str*	Software architecture.	
:released	*time*	Timestamp for when this version of the software was released.	
:semver	*it:semver*	System normalized semantic version number.	
:semver:major	*int*	Version major number.	
:semver:minor	*int*	Version minor number.	
:semver:patch	*int*	Version patch number.	
:semver:pre	*str*	Semver prerelease string.	
:semver:build	*str*	Semver build string.	
:url	*inet:url*	URL where a specific version of the software is available	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:reveng:filefunc

An instance of a function in an executable.

The base type for the form can be found at *it:reveng:filefunc*.

Properties:

name	type	doc	opts
:function	*it:reveng:function*	The guid matching the function.	Read Only: True
:file	*file:bytes*	The file that contains the function.	Read Only: True
:va	*int*	The virtual address of the first codeblock of the function.	
:rank	*int*	The function rank score used to evaluate if it exhibits interesting behavior.	
:complexity	*int*	The complexity of the function.	
:funccalls	*array* type: *it:reveng:filefunc* uniq: True sorted: True	Other function calls within the scope of the function.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.

continues on next page

Table 293 – continued from previous page

source	verb	target	doc
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:reveng:funcstr

A reference to a string inside a function.

The base type for the form can be found at *it:reveng:funcstr*.

Properties:

name	type	doc	opts
:function	*it:reveng:function*	The guid matching the function.	Read Only: True
:string	*str*	The string that the function references.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:reveng:function

A function inside an executable.

The base type for the form can be found at *it:reveng:function*.

Properties:

name	type	doc
:name	*str*	The name of the function.
:description	*str*	Notes concerning the function.
:impcalls	*array* type: *it:reveng:impfunc* uniq: True sorted: True	Calls to imported library functions within the scope of the function.
:strings	*array* type: *it:dev:str* uniq: True	An array of strings referenced within the function.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:screenshot

A screenshot of a host.

The base type for the form can be found at *it:screenshot*.

Properties:

name	type	doc	opts
:image	*file:bytes*	The image file.	
:desc	*str*	A brief description of the screenshot.	Display: {'hint': 'text'}
:exe	*file:bytes*	The executable file which caused the activity.	
:proc	*it:exec:proc*	The host process which caused the activity.	
:thread	*it:exec:thre*	The host thread which caused the activity.	
:host	*it:host*	The host on which the activity occurred.	
:time	*time*	The time that the activity started.	
:sandbox:f:	*file:bytes*	The initial sample given to a sandbox environment to analyze.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:sec:c2:config

An extracted C2 config from an executable.

The base type for the form can be found at *it:sec:c2:config*.

Properties:

name	type	doc
:family	*it:prod:softname*	The name of the software family which uses the config.
:file	*file:bytes*	The file that the C2 config was extracted from.
:decoys	*array* type: *inet:url*	An array of URLs used as decoy connections to obfuscate the C2 servers.
:servers	*array* type: *inet:url*	An array of connection URLs built from host/port/passwd combinations.
:proxies	*array* type: *inet:url*	An array of proxy URLs used to communicate with the C2 server.
:listens	*array* type: *inet:url*	An array of listen URLs that the software should bind.
:dns:resolvers	*array* type: *inet:server*	An array of inet:servers to use when resolving DNS names.
:mutex	*it:dev:mutex*	The mutex that the software uses to prevent multiple-installations.
:campaigncode	*it:dev:str*	The operator selected string used to identify the campaign or group of targets.
:crypto:key	*crypto:key*	Static key material used to encrypt C2 communications.
:connect:delay	*duration*	The time delay from first execution to connecting to the C2 server.
:connect:interval	*duration*	The configured duration to sleep between connections to the C2 server.
:raw	*data*	A JSON blob containing the raw config extracted from the binary.
:http:headers	*array* type: *inet:http:header*	An array of HTTP headers that the sample should transmit to the C2 server.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:sec:cpe

A NIST CPE 2.3 Formatted String.

The base type for the form can be found at *it:sec:cpe*.

Properties:

name	type	doc	opts
:v2_2	*it:sec:cpe:v2_2*	The CPE 2.2 string which is equivalent to the primary property.	
:part	*str* lower: True strip: True	The "part" field from the CPE 2.3 string.	Read Only: True
:vendor	*ou:name*	The "vendor" field from the CPE 2.3 string.	Read Only: True
:product	*str* lower: True strip: True	The "product" field from the CPE 2.3 string.	Read Only: True
:version	*str* lower: True strip: True	The "version" field from the CPE 2.3 string.	Read Only: True
:update	*str* lower: True strip: True	The "update" field from the CPE 2.3 string.	Read Only: True
:edition	*str* lower: True strip: True	The "edition" field from the CPE 2.3 string.	Read Only: True
:language	*str* lower: True strip: True	The "language" field from the CPE 2.3 string.	Read Only: True
:sw_edition	*str* lower: True strip: True	The "sw_edition" field from the CPE 2.3 string.	Read Only: True
:target_sw	*str* lower: True strip: True	The "target_sw" field from the CPE 2.3 string.	Read Only: True
:target_hw	*str* lower: True strip: True	The "target_hw" field from the CPE 2.3 string.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc

econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:sec:cve

A vulnerability as designated by a Common Vulnerabilities and Exposures (CVE) number.

The base type for the form can be found at *it:sec:cve*.

An example of `it:sec:cve`:

- `cve-2012-0158`

Properties:

name	type	doc	opts
:desc	*str*	Deprecated. Please use risk:vuln:cve:desc.	Deprecated: True
:url	*inet:url*	Deprecated. Please use risk:vuln:cve:url.	Deprecated: True
:references	*array* type: *inet:url* uniq: True sorted: True	Deprecated. Please use risk:vuln:cve:referen	Deprecated: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.

Table 300 – continued from previous page

source	verb	target	doc
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:sec:cwe

NIST NVD Common Weaknesses Enumeration Specification.

The base type for the form can be found at *it:sec:cwe*.

An example of `it:sec:cwe`:

- `CWE-120`

  Properties:

name	type	doc	opts
:name	*str*	The CWE description field.	Example: `Buffer Copy without Checking Size of Input (Classic Buffer Overflow)`
:desc	*str*	The CWE description field.	Display: `{'hint': 'text'}`
:url	*inet:url*	A URL linking this CWE to a full description.	
:parents	*array* type: *it:sec:cwe* uniq: `True` sorted: `True` split: `,`	An array of ChildOf CWE Relationships.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.

ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:sec:metrics

A node used to track metrics of an organization's infosec program.

The base type for the form can be found at *it:sec:metrics*.

Properties:

name	type	doc
:org	*ou:org*	The organization whose security program is being measured.
:org:name	*ou:nan*	The organization name. Used for entity resolution.
:org:fqdn	*inet:fq*	The organization FQDN. Used for entity resolution.
:period	*ival*	The time period used to compute the metrics.
:alerts:meantime:tri	*duration*	The mean time to triage alerts generated within the time period.
:alerts:count	*int*	The total number of alerts generated within the time period.
:alerts:falsepos	*int*	The number of alerts generated within the time period that were determined to be false positives.
:assets:hosts	*int*	The total number of hosts within scope for the information security program.
:assets:users	*int*	The total number of users within scope for the information security program.
:assets:vulns:count	*int*	The number of asset vulnerabilities being tracked at the end of the time period.
:assets:vulns:preexi	*int*	The number of asset vulnerabilities being tracked at the beginning of the time period.
:assets:vulns:discov	*int*	The number of asset vulnerabilities discovered during the time period.
:assets:vulns:mitiga	*int*	The number of asset vulnerabilities mitigated during the time period.
:assets:vulns:meanti	*duration*	The mean time to mitigate for vulnerable assets mitigated during the time period.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

Table 303 – continued from previous page

source	verb	target	doc
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:sec:stix:indicator

A STIX indicator pattern.

The base type for the form can be found at *it:sec:stix:indicator*.

Properties:

name	type	doc
:id	*str*	The STIX id field from the indicator pattern.
:name	*str*	The name of the STIX indicator pattern.
:pattern	*str*	The STIX indicator pattern text.
:created	*time*	The time that the indicator pattern was first created.
:updated	*time*	The time that the indicator pattern was last modified.
:labels	*array* type: *str* uniq: True sorted: True	The label strings embedded in the STIX indicator pattern.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

source	verb	target	doc
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:sec:vuln:scan

An instance of running a vulnerability scan.

The base type for the form can be found at *it:sec:vuln:scan*.

Properties:

name	type	doc	opts
:time	*time*	The time that the scan was started.	
:desc	*str*	Description of the scan and scope.	Display: {'hint': 'text'}
:ext:id	*str*	An externally generated ID for the scan.	
:ext:url	*inet:url*	An external URL which documents the scan.	
:software	*it:prod:softver*	The scanning software used.	
:software:na	*it:prod:softnar*	The name of the scanner software.	
:operator	*ps:contact*	Contact information for the scan operator.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

it:sec:vuln:scan:result

A vulnerability scan result for an asset.

The base type for the form can be found at *it:sec:vuln:scan:result*.

Properties:

name	type	doc
:scan	*it:sec:vuln:sc*	The scan that discovered the vulnerability in the asset.
:vuln	*risk:vuln*	The vulnerability detected in the asset.
:asset	*ndef*	The node which is vulnerable.
:desc	*str*	A description of the vulnerability and how it was detected in the asset.
:time	*time*	The time that the scan result was produced.
:ext:id	*str*	An externally generated ID for the scan result.
:ext:url	*inet:url*	An external URL which documents the scan result.
:mitigatic	*risk:mitigatio*	The mitigation used to address this asset vulnerability.
:mitigatec	*time*	The time that the vulnerability in the asset was mitigated.
:priority	*meta:priority*	The priority of mitigating the vulnerability.
:severity	*meta:severity*	The severity of the vulnerability in the asset. Use "none" for no vulnerability discovered.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.

ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

lang:name

A name used to refer to a language.

The base type for the form can be found at *lang:name*.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

lang:trans

Deprecated. Please use lang:translation.

The base type for the form can be found at *lang:trans*.

Properties:

name	type	doc	opts
`:text:en`	*str*	English translation.	Display: `{'hint': 'text'}`
`:desc:en`	*str*	English description.	Display: `{'hint': 'text'}`

Source Edges:

source	verb	target	doc
`*`	`-(meets)>`	`ou:requiremen`	The requirement is met by the source node.
`*`	`-(refs)>`	`*`	The source node contains a reference to the target node.
`*`	`-(seenat)>`	`geo:telem`	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
`*`	`-(refs)>`	`*`	None
`econ:purchase`	`-(acquired)>`	`*`	The purchase was used to acquire the target node.
`it:app:snort:rule`	`-(detects)>`	`*`	The snort rule is intended for use in detecting the target node.
`it:app:yara:rule`	`-(detects)>`	`*`	The YARA rule is intended for use in detecting the target node.
`it:exec:query`	`-(found)>`	`*`	The target node was returned as a result of running the query.
`meta:note`	`-(about)>`	`*`	The meta:note is about the target node.
`meta:rule`	`-(detects)>`	`*`	The meta:rule is designed to detect instances of the target node.
`meta:rule`	`-(matches)>`	`*`	The meta:rule has matched on target node.
`meta:source`	`-(seen)>`	`*`	The meta:source observed the target node.
`ou:campaign`	`-(targets)>`	`*`	The campaign targeted the target nodes.
`ou:campaign`	`-(uses)>`	`*`	The campaign made use of the target node.

risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

lang:translation

A translation of text from one language to another.

The base type for the form can be found at *lang:translation*.

Properties:

name	type	doc	opts
:input	*str*	The input text.	Example: hola
:input:lang	*lang:code*	The input language code.	
:output	*str*	The output text.	Example: hi
:output:lan	*lang:code*	The output language code.	
:desc	*str*	A description of the meaning of the output.	Example: A standard greeting
:engine	*it:prod:softve*	The translation engine version used.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

mat:item

A GUID assigned to a material object.

The base type for the form can be found at *mat:item*.

Properties:

name	type	doc
:name	*str* lower: True	The name of the material item.
:type	*mat:type*	The taxonomy type of the item.
:spec	*mat:spec*	The specification which defines this item.
:place	*geo:place*	The most recent place the item is known to reside.
:latlong	*geo:latlong*	The last known lat/long location of the node.
:loc	*loc*	The geo-political location string for the node.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.

sci:observation	-(has)>	*	The observations are summarized from the target nodes.

media:news

A GUID for a news article or report.

The base type for the form can be found at *media:news*.

Properties:

name	type	doc	opts
`:url`	*inet:url*	The (optional) URL where the news was published.	Example: `http://cnn.com/news/mars-lander.html`
`:url:fqdn`	*inet:fqdn*	The FQDN within the news URL.	Example: `cnn.com`
`:type`	*media:news:taxonomy*	A taxonomy for the type of reporting or news.	
`:file`	*file:bytes*	The (optional) file blob containing or published as the news.	
`:title`	*str* lower: `True`	Title/Headline for the news.	Example: `mars lander reaches mars` Display: `{'hint': 'text'}`
`:summary`	*str*	A brief summary of the news item.	Example: `lorum ipsum` Display: `{'hint': 'text'}`
`:publisher`	*ou:org*	The organization which published the news.	
`:publisher:name`	*ou:name*	The name of the publishing org used to publish the news.	
`:published`	*time*	The date the news item was published.	Example: `20161201180433`
`:updated`	*time* ismax: `True`	The last time the news item was updated.	Example: `20161201180433`
`:org`	*ou:alias*	Deprecated. Please use :publisher:name.	Deprecated: `True`
`:author`	*ps:name*	Deprecated. Please use :authors array of ps:contact nodes.	Deprecated: `True`
`:authors`	*array* type: *ps:contact* split: `,` uniq: `True` sorted: `True`	An array of authors of the news item.	
`:rss:feed`	*inet:url*	The RSS feed that published the news.	
`:ext:id`	*str*	An external identifier specified by the publisher.	
`:topics`		An array of relevant

ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

media:news:taxonomy

A taxonomy of types or sources of news.

The base type for the form can be found at *media:news:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*media:news:taxonomy*	The taxonomy parent.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.

Table 317 – continued from previous page

source	verb	target	doc
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

media:topic

A topic string.

The base type for the form can be found at *media:topic*.

Properties:

name	type	doc
:desc	*str*	A brief description of the topic.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.

Table 318 – continued from previous page

source	verb	target	doc
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

meta:event

An analytically relevant event in a curated timeline.

The base type for the form can be found at *meta:event*.

Properties:

name	type	doc	opts
:timeline	*meta:timeline*	The timeline containing the event.	
:title	*str*	A title for the event.	
:summary	*str*	A prose summary of the event.	Display: {'hint': 'text'}
:time	*time*	The time that the event occurred.	
:duration	*duration*	The duration of the event.	
:type	*meta:event:taxonom*	Type of event.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

meta:event:taxonomy

A taxonomy of event types for meta:event nodes.

The base type for the form can be found at *meta:event:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*meta:event:taxonomy*	The taxonomy parent.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.

continues on next page

Table 320 – continued from previous page

source	verb	target	doc
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

meta:note

An analyst note about nodes linked with -(about)> edges.

The base type for the form can be found at *meta:note*.

Properties:

name	type	doc	opts
:type	*meta:note:type:ta*	The note type.	
:text	*str*	The analyst authored note text.	Display: {'hint': 'text', 'syntax': 'markdown'}
:autho:	*ps:contact*	The contact information of the author.	
:creat	*syn:user*	The synapse user who authored the note.	
:creat	*time*	The time the note was created.	
:updat	*time*	The time the note was updated.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremer	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat):	geo:telem	The source node was seen at the geo:telem node place and time.
meta:note	-(about)>	*	The meta:note is about the target node.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

meta:note:type:taxonomy

An analyst note type taxonomy.

The base type for the form can be found at *meta:note:type:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*meta:note:type:taxonon*	The taxonomy parent.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.

Table 322 – continued from previous page

source	verb	target	doc
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

meta:rule

A generic rule linked to matches with -(matches)> edges.

The base type for the form can be found at *meta:rule*.

Properties:

name	type	doc	opts
:name	*str* lower: True onespace: True	A name for the rule.	
:desc	*str*	A description of the rule.	Display: {'hint': 'text'}
:text	*str*	The text of the rule logic.	Display: {'hint': 'text'}
:author	*ps:contact*	The contact information of the rule author.	
:created	*time*	The time the rule was initially created.	
:updated	*time*	The time the rule was most recently modified.	
:url	*inet:url*	A URL which documents the rule.	
:ext:id	*str*	An external identifier for the rule.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremer	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.
meta:rule	-(detects)	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)	*	The meta:rule has matched on target node.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target noc
it:exec:query	-(found)>	*	The target node was returned as a result of running the query
meta:note	-(about)>	*	The meta:note is about the target node.
meta:ruleset	-(has)>	meta:rule	The meta:ruleset includes the meta:rule.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

meta:ruleset

A set of rules linked with -(has)> edges.

The base type for the form can be found at *meta:ruleset*.

Properties:

name	type	doc	opts
:name	*str* lower: True onespace: True	A name for the ruleset.	
:desc	*str*	A description of the ruleset.	Display: {'hint': 'text'}
:author	*ps:contact*	The contact information of the ruleset author.	
:created	*time*	The time the ruleset was initially created.	
:updated	*time*	The time the ruleset was most recently modified.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.
meta:rulese	-(has)>	meta:rule	The meta:ruleset includes the meta:rule.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.

Table 324 – continued from previous page

source	verb	target	doc
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

meta:seen

Annotates that the data in a node was obtained from or observed by a given source.

The base type for the form can be found at *meta:seen*.

Properties:

name	type	doc	opts
:source	*meta:source*	The source which observed or provided the node.	Read Only: True
:node	*ndef*	The node which was observed by or received from the source.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

meta:source

A data source unique identifier.

The base type for the form can be found at *meta:source*.

Properties:

name	type	doc
:name	*str* lower: True	A human friendly name for the source.
:type	*str* lower: True	An optional type field used to group sources.
:url	*inet:url*	A URL which documents the meta source.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.
meta:sourc	-(seen)>	*	The meta:source observed the target node.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise

Table 326 – continued from previous page

source	verb	target	doc
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

meta:timeline

A curated timeline of analytically relevant events.

The base type for the form can be found at *meta:timeline*.

Properties:

name	type	doc	opts
:title	*str*	A title for the timeline.	Example: The history of the Vertex Project
:summar	*str*	A prose summary of the timeline.	Display: {'hint': 'text'}
:type	*meta:timeline:taxo*	The type of timeline.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.

continues on next page

Table 327 – continued from previous page

source	verb	target	doc
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

meta:timeline:taxonomy

A taxonomy of timeline types for meta:timeline nodes.

The base type for the form can be found at *meta:timeline:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: `True` Display: `{'hint': 'text'}`
:desc	*str*	A definition of the taxonomy entry.	Display: `{'hint': 'text'}`
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: `True`
:depth	*int*	The depth indexed from 0.	Read Only: `True`
:parent	*meta:timeline:taxonom*	The taxonomy parent.	Read Only: `True`

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:attendee

A node representing a person attending a meeting, conference, or event.

The base type for the form can be found at *ou:attendee*.

Properties:

name	type	doc
:person	*ps:contact*	The contact information for the person who attended the event.
:arrived	*time*	The time when the person arrived.
:departed	*time*	The time when the person departed.
:roles	*array* type: *ou:role* split: , uniq: True sorted: True	List of the roles the person had at the event.
:meet	*ou:meet*	The meeting that the person attended.
:conference	*ou:conference*	The conference that the person attended.
:conference:event	*ou:conference:event*	The conference event that the person attended.
:contest	*ou:contest*	The contest that the person attended.
:preso	*ou:preso*	The presentation that the person attended.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.

Table 329 – continued from previous page

source	verb	target	doc
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:award

An award issued by an organization.

The base type for the form can be found at *ou:award*.

Properties:

name	type	doc	opts
:name	*str* lower: True onespace: True	The name of the award.	Example: Bachelors of Science
:type	*str* lower: True onespace: True	The type of award.	Example: certification
:org	*ou:org*	The organization which issues the award.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:campaign

Represents an org's activity in pursuit of a goal.

The base type for the form can be found at *ou:campaign*.

Properties:

name	type	doc	opts
:org	*ou:org*	The org carrying out the campaign.	
:org:name	*ou:name*	The name of the org responsible for the campaign. Used for entity resolution.	
:org:fqdn	*inet:fqdn*	The FQDN of the org responsible for the campaign. Used for entity resolution.	
:goal	*ou:goal*	The assessed primary goal of the campaign.	
:actors	*array* type: *ps:contact* split: `,` uniq: `True` sorted: `True`	Actors who participated in the campaign.	
:goals	*array* type: *ou:goal* split: `,` uniq: `True` sorted: `True`	Additional assessed goals of the campaign.	
:success	*bool*	Records the success/failure status of the campaign if known.	
:name	*ou:campname*	A terse name of the campaign.	Example: `operation overlord`
:names	*array* type: *ou:campname* sorted: `True` uniq: `True`	An array of alternate names for the campaign.	
:reporter	*ou:org*	The organization reporting on the campaign.	
:reporter:name	*ou:name*	The name of the organization reporting on the campaign.	
:type	*str*	Deprecated. Use the :camptype taxonomy.	Deprecated: `True`
:sophistication	*meta:sophistication*	The assessed sophistication of the campaign.	
:timeline	*meta:timeline*	A timeline of significant events related to the campaign.	
:camptype	*ou:camptype*	The campaign type taxonomy.	Display: `{'hint': 'taxonomy'}`

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme:	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.
ou:campaig	-(targets)	*	The campaign targeted the target nodes.
ou:campaig	-(uses)>	ou:technique	The campaign used the technique.
ou:campaig	-(uses)>	*	The campaign made use of the target node.

Target Edges:

source	verb	tar-get	doc

econ:purchase	-(acquired)	*	The purchase was used to acquire the target node.
it:app:snort:ru	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rul	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:contribution	-(includes)	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise.
risk:extortion	-(leveraged	*	The extortion event was based on attacker access to the target node.
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:softw	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:campname

A campaign name.

The base type for the form can be found at *ou:campname*.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:camptype

An campaign type taxonomy.

The base type for the form can be found at *ou:camptype*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*ou:camptype*	The taxonomy parent.	Read Only: True

Source Edges:

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:conference

A conference with a name and sponsoring org.

The base type for the form can be found at *ou:conference*.

Properties:

name	type	doc	opts
:org	*ou:org*	The org which created/managed the conference.	
:organizer	*ps:contact*	Contact information for the primary organizer of the conference.	
:sponsors	*array* type: *ps:contact* uniq: True sorted: True	An array of contacts which sponsored the conference.	
:name	*str* lower: True	The full name of the conference.	Example: decfon 2017
:desc	*str* lower: True	A description of the conference.	Example: annual cybersecurity conference Display: {'hint': 'text'}
:base	*str* lower: True strip: True	The base name which is shared by all conference instances.	Example: defcon
:start	*time*	The conference start date / time.	
:end	*time*	The conference end date / time.	
:place	*geo:place*	The geo:place node where the conference was held.	
:url	*inet:url*	The inet:url node for the conference website.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:conference:attendee

Deprecated. Please use ou:attendee.

The base type for the form can be found at *ou:conference:attendee*.

Properties:

name	type	doc	opts
:conference	*ou:conference*	The conference which was attended.	Read Only: True
:person	*ps:person*	The person who attended the conference.	Read Only: True
:arrived	*time*	The time when a person arrived to the conference.	
:departed	*time*	The time when a person departed from the conference.	
:role:staff	*bool*	The person worked as staff at the conference.	
:role:speaker	*bool*	The person was a speaker or presenter at the conference.	
:roles	*array* type: *str* uniq: True sorted: True	List of the roles the person had at the conference.

ou:contest

A competitive event resulting in a ranked set of participants.

The base type for the form can be found at *ou:contest*.

Properties:

name	type	doc	opts
:name	*str* lower: True onespace: True	The name of the contest.	Example: defcon ctf 2020
:type	*str* lower: True onespace: True	The type of contest.	Example: cyber ctf
:family	*str* lower: True onespace: True	A name for a series of recurring contests.	Example: defcon ctf
:desc	*str* lower: True	A description of the contest.	Example: the capture-the-flag event hosted at defcon 2020 Display: {'hint': 'text'}
:url	*inet:url*	The contest website URL.	
:start	*time*	The contest start date / time.	
:end	*time*	The contest end date / time.	
:loc	*loc*	The geopolitical affiliation of the contest.	
:place	*geo:place*	The geo:place where the contest was held.	
:latlong	*geo:latlong*	The latlong where the contest was held.	
:conference	*ou:conference*	The conference that the contest is associated with.	
:contests	*array* type: *ou:contest* split: , uniq: True sorted: True	An array of sub-contests that contributed to the rankings.	
:sponsors	*array* type: *ps:contact* split: , uniq: True sorted: True	Contact information for contest sponsors.	
:organizers		Contact information

ou:contract

An contract between multiple entities.

The base type for the form can be found at *ou:contract*.

Properties:

name	type	doc	opts
:title	*str*	A terse title for the contract.	
:type	*ou:conttype*	The type of contract.	
:sponsor	*ps:contact*	The contract sponsor.	
:parties	*array* type: *ps:contact* uniq: `True` sorted: `True`	The non-sponsor entities bound by the contract.	
:document	*file:bytes*	The best/current contract document.	
:signed	*time*	The date that the contract signing was complete.	
:begins	*time*	The date that the contract goes into effect.	
:expires	*time*	The date that the contract expires.	
:completed	*time*	The date that the contract was completed.	
:terminated	*time*	The date that the contract was terminated.	
:award:price	*econ:price*	The value of the contract at time of award.	
:budget:price	*econ:price*	The amount of money budgeted for the contract.	
:currency	*econ:currency*	The currency of the econ:price values.	
:purchase	*econ:purchase*	Purchase details of the contract.	
:requirements	*array* type: *ou:goal* uniq: `True` sorted: `True`	The requirements levied upon the parties.	
:types	*array* type: *ou:contract:type* split: `,` uniq: `True` sorted: `True`	A list of types that apply to the contract.	Deprecated: `True`

Source Edges:

source	verb	target	doc

ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:contribution

Represents a specific instance of contributing material support to a campaign.

The base type for the form can be found at *ou:contribution*.

Properties:

name	type	doc
:from	*ps:contact*	The contact information of the contributor.
:campaign	*ou:campaign*	The campaign receiving the contribution.
:value	*econ:price*	The assessed value of the contribution.
:currency	*econ:currency*	The currency used for the assessed value.
:time	*time*	The time the contribution occurred.
:material:spec	*mat:spec*	The specification of material items contributed.
:material:count	*int*	The number of material items contributed.
:monetary:payment	*econ:acct:payment*	Payment details for a monetary contribution.
:personnel:count	*int*	Number of personnel contributed to the campaign.
:personnel:jobtitle	*ou:jobtitle*	Title or designation for the contributed personnel.

Source Edges:

source	verb	target	doc

sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:employment

An employment type taxonomy.

The base type for the form can be found at *ou:employment*.

An example of `ou:employment`:

- `fulltime.salary`

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*ou:employment*	The taxonomy parent.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.

source	verb	target	doc
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:goal

An assessed or stated goal which may be abstract or org specific.

The base type for the form can be found at *ou:goal*.

Properties:

name	type	doc	opts
:name	*ou:goalname*	A terse name for the goal.	
:names	*array* type: *ou:goalname* sorted: True uniq: True	An array of alternate names for the goal. Used to merge/resolve goals.	
:type	*ou:goal:type:taxonomy*	A type taxonomy entry for the goal.	
:desc	*str*	A description of the goal.	Display: {'hint': 'text'}
:prev	*ou:goal*	Deprecated. Please use ou:goal:type taxonomy.	Deprecated: True

Source Edges:

it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:id:number

A unique id number issued by a specific organization.

The base type for the form can be found at *ou:id:number*.

Properties:

name	type	doc	opts
:type	*ou:id:type*	The type of org id.	Read Only: True
:value	*ou:id:value*	The value of org id.	Read Only: True
:status	*str* lower: True strip: True	A freeform status such as valid, suspended, expired.	
:issued	*time*	The time at which the org issued the ID number.	
:expires	*time*	The time at which the ID number expires.	
:issuer	*ps:contact*	The contact information of the office which issued the ID number.	

Source Edges:

it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:industry

An industry classification type.

The base type for the form can be found at *ou:industry*.

Properties:

name	type	doc	opts
:name	*ou:industryname*	The name of the industry.	
:type	*ou:industry:type:taxon*	A taxonomy entry for the industry.	
:names	*array* type: *ou:industryname* uniq: True sorted: True	An array of alternative names for the industry.	
:subs	*array* type: *ou:industry* split: , uniq: True sorted: True	Deprecated. Please use ou:industry:type taxonomy.	Deprecated: True
:sic	*array* type: *ou:sic* split: , uniq: True sorted: True	An array of SIC codes that map to the industry.	
:naics	*array* type: *ou:naics* split: , uniq: True sorted: True	An array of NAICS codes that map to the industry.	
:isic	*array* type: *ou:isic* split: , uniq: True sorted: True	An array of ISIC codes that map to the industry.	
:desc	*str*	A description of the industry.	Display: {'hint': 'text'}

`risk:threat`	`-(uses)>`	`*`	The threat cluster uses the target node.
`risk:tool:software`	`-(uses)>`	`*`	The tool uses the target node.
`sci:evidence`	`-(has)>`	`*`	The evidence includes observations from the target nodes.
`sci:experiment`	`-(uses)>`	`*`	The experiment used the target nodes when it was run.
`sci:observation`	`-(has)>`	`*`	The observations are summarized from the target nodes.

ou:jobtype

A taxonomy of job types.

The base type for the form can be found at *ou:jobtype*.

An example of `ou:jobtype`:

- `it.dev.python`

Properties:

name	type	doc	opts
`:title`	*str*	A brief title of the definition.	
`:summary`	*str*	Deprecated. Please use title/desc.	Deprecated: `True` Display: `{'hint': 'text'}`
`:desc`	*str*	A definition of the taxonomy entry.	Display: `{'hint': 'text'}`
`:sort`	*int*	A display sort order for siblings.	
`:base`	*taxon*	The base taxon.	Read Only: `True`
`:depth`	*int*	The depth indexed from 0.	Read Only: `True`
`:parent`	*ou:jobtype*	The taxonomy parent.	Read Only: `True`

Source Edges:

source	verb	target	doc
`*`	`-(meets)>`	`ou:requireme`	The requirement is met by the source node.
`*`	`-(refs)>`	`*`	The source node contains a reference to the target node.
`*`	`-(seenat)`	`geo:telem`	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
`*`	`-(refs)>`	`*`	None
`econ:purchase`	`-(acquired)>`	`*`	The purchase was used to acquire the target node.
`it:app:snort:rule`	`-(detects)>`	`*`	The snort rule is intended for use in detecting the target node.
`it:app:yara:rule`	`-(detects)>`	`*`	The YARA rule is intended for use in detecting the target nod
`it:exec:query`	`-(found)>`	`*`	The target node was returned as a result of running the query.
`meta:note`	`-(about)>`	`*`	The meta:note is about the target node.

it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:meet:attendee

Deprecated. Please use ou:attendee.

The base type for the form can be found at *ou:meet:attendee*.

Properties:

name	type	doc	opts
:meet	*ou:meet*	The meeting which was attended.	Read Only: True
:person	*ps:person*	The person who attended the meeting.	Read Only: True
:arrived	*time*	The time when a person arrived to the meeting.	
:departed	*time*	The time when a person departed from the meeting.	

Source Edges:

ou:opening

A job/work opening within an org.

The base type for the form can be found at *ou:opening*.

Properties:

name	type	doc
:org	*ou:org*	The org which has the opening.
:orgname	*ou:name*	The name of the organization as listed in the opening.
:orgfqdn	*inet:fqdn*	The FQDN of the organization as listed in the opening.
:posted	*time*	The date/time that the job opening was posted.
:removed	*time*	The date/time that the job opening was removed.
:postings	*array* type: *inet:url* uniq: `True` sorted: `True`	URLs where the opening is listed.
:contact	*ps:contact*	The contact details to inquire about the opening.
:loc	*loc*	The geopolitical boundary of the opening.
:jobtype	*ou:jobtype*	The job type taxonomy.
:employment	*ou:employment*	The type of employment.
:jobtitle	*ou:jobtitle*	The title of the opening.
:remote	*bool*	Set to true if the opening will allow a fully remote worker.
:yearlypay	*econ:price*	The yearly income associated with the opening.
:paycurrency	*econ:currency*	The currency that the yearly pay was delivered in.

ou:org

A GUID for a human organization such as a company or military unit.

The base type for the form can be found at *ou:org*.

Properties:

name	type	doc	opts
:loc	*loc*	Location for an organization.	
:name	*ou:name*	The localized name of an organization.	
:type	*str* lower: `True` strip: `True`	The type of organization.	Deprecated: `True`
:orgtype	*ou:orgtype*	The type of organization.	Display: `{'hint': 'taxonomy'}`
:vitals	*ou:vitals*	The most recent/accurate ou:vitals for the org.	
:desc	*str*	A description of the org.	Display: `{'hint': 'text'}`
:logo	*file:bytes*	An image file representing the logo for the organization.	
:names	*array* type: *ou:name* uniq: `True` sorted: `True`	A list of alternate names for the organization.	
:alias	*ou:alias*	The default alias for an organization.	
:phone	*tel:phone*	The primary phone number for the organization.	
:sic	*ou:sic*	The Standard Industrial Classification code for the organization.	Deprecated: `True`
:naics	*ou:naics*	The North American Industry Classification System code for the organization.	Deprecated: `True`
:industries	*array* type: *ou:industry* uniq: `True` sorted: `True`	The industries associated with the org.	
:us:cage	*gov:us:cage*	The Commercial and Government Entity (CAGE) code for the organization.	
:founded	*time*	The date on which the org was founded.	
:dissolved	*time*	The date on which the org was dissolved.	
:url	*inet:url*	The primary url for the organization.	

Source Edges:

source	verb	target	doc

meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:orgtype

An org type taxonomy.

The base type for the form can be found at *ou:orgtype*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*ou:orgtype*	The taxonomy parent.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.

source	verb	target	doc
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:position

A position within an org. May be organized into an org chart.

The base type for the form can be found at *ou:position*.

Properties:

name	type	doc
:org	*ou:org*	The org which has the position.
:team	*ou:team*	The team that the position is a member of.
:contact	*ps:contact*	The contact info for the person who holds the position.
:title	*str* lower: True onespace: True	The title of the position.
:reports	*array* type: *ou:position* uniq: True sorted: True	An array of positions which report to this position.

Source Edges:

source	verb	target	doc

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:preso

A webinar, conference talk, or other type of presentation.

The base type for the form can be found at *ou:preso*.

Properties:

name	type	doc	opts
:organizer	*ps:contact*	Contact information for the primary organizer of the presentation.	
:sponsors	*array* type: *ps:contact* uniq: `True` sorted: `True`	A set of contacts which sponsored the presentation.	
:presenters	*array* type: *ps:contact* uniq: `True` sorted: `True`	A set of contacts which gave the presentation.	
:title	*str* lower: `True`	The full name of the presentation.	Example: `Synapse 101 - 2021/06/22`
:desc	*str* lower: `True`	A description of the presentation.	Display: `{'hint': 'text'}`
:time	*time*	The scheduled presentation start time.	
:duration	*duration*	The scheduled duration of the presentation.	
:loc	*loc*	The geopolitical location string for where the presentation was given.	
:place	*geo:place*	The geo:place node where the presentation was held.	
:deck:url	*inet:url*	The URL hosting a copy of the presentation materials.	
:deck:file	*file:bytes*	A file containing the presentation materials.	
:attendee:url	*inet:url*	The URL visited by live attendees of the presentation.	
:recording:url	*inet:url*	The URL hosting a recording of the presentation.	
:recording:file	*file:bytes*	A file containing a recording of the presentation.	
:conference	*ou:conference*	The conference which hosted the presentation.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.

it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:requirement

A specific requirement.

The base type for the form can be found at *ou:requirement*.

Properties:

name	type	doc	opts
:name	*str* lower: True onespace: True	A name for the requirement.	
:text	*str*	The text of the stated requirement.	Display: {'hint': 'text'}
:optional	*bool*	Set to true if the requirement is optional.	
:priority	*meta:priority*	The priority of the requirement.	
:goal	*ou:goal*	The goal that the requirement is designed to achieve.	
:active	*bool*	Set to true if the requirement is currently active.	
:issued	*time*	The time that the requirement was first issued.	
:period	*ival*	The time window where the goal must be met. Can be ongoing.	
:issuer	*ps:contact*	The contact information of the entity which issued the requirement.	
:assignee	*ps:contact*	The contact information of the entity which is assigned to meet the requirement.	
:deps	*array* type: *ou:requirement* sorted: True uniq: True	A list of sub-requirements which must be met to complete the requirement.	
:deps:min	*int* min: 0	The minimum number dependant requirements which must be met. If unset, assume all must be met.	

Source Edges:

source	verb	target	doc

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target node

ou:suborg

Any parent/child relationship between two orgs. May represent ownership, organizational structure, etc.

The base type for the form can be found at *ou:suborg*.

Properties:

name	type	doc	opts
:org	*ou:org*	The org which owns the sub organization.	Read Only: True
:sub	*ou:org*	The sub org which owned by the org.	Read Only: True
:perc	*int* min: 0 max: 100	The optional percentage of sub which is owned by org.	
:founded	*time*	The date on which the suborg relationship was founded.	
:dissolved	*time*	The date on which the suborg relationship was dissolved.	
:current	*bool*	Bool indicating if the suborg relationship still current.	

Source Edges:

source	verb	target	doc

sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:technique

A specific technique used to achieve a goal.

The base type for the form can be found at *ou:technique*.

Properties:

name	type	doc	opts
:name	*str* lower: True onespace: True	The normalized name of the technique.	
:type	*ou:technique:taxonomy*	The taxonomy classification of the technique.	
:sophistication	*meta:sophistication*	The assessed sophistication of the technique.	
:desc	*str*	A description of the technique.	Display: {'hint': 'text'}
:tag	*syn:tag*	The tag used to annotate nodes where the technique was employed.	
:mitre:attack:tech	*it:mitre:attack:techniqu*	A mapping to a MITRE ATT&CK technique if applicable.	
:reporter	*ou:org*	The organization reporting on the technique.	
:reporter:name	*ou:name*	The name of the organization reporting on the technique.	

Source Edges:

source	verb	target	doc

sci:evidence	-(has)>	*	The evidence includes observations from the target nodes
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ou:technique:taxonomy

An analyst defined taxonomy to classify techniques in different disciplines.

The base type for the form can be found at *ou:technique:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*ou:technique:taxonomy*	The taxonomy parent.	Read Only: True

`sci:experiment`	`-(uses)>`	*	The experiment used the target nodes when it was run.
`sci:observation`	`-(has)>`	*	The observations are summarized from the target nodes.

ou:vitals

Vital statistics about an org for a given time period.

The base type for the form can be found at *ou:vitals*.

Properties:

name	type	doc
`:asof`	*time*	The time that the vitals represent.
`:org`	*ou:org*	The resolved org.
`:orgname`	*ou:name*	The org name as reported by the source of the vitals.
`:orgfqdn`	*inet:fqdn*	The org FQDN as reported by the source of the vitals.
`:currency`	*econ:currency*	The currency of the econ:price values.
`:costs`	*econ:price*	The costs/expenditures over the period.
`:revenue`	*econ:price*	The gross revenue over the period.
`:profit`	*econ:price*	The net profit over the period.
`:valuation`	*econ:price*	The assessed value of the org.
`:shares`	*int*	The number of shares outstanding.
`:population`	*int*	The population of the org.
`:delta:costs`	*econ:price*	The change in costs over last period.
`:delta:revenue`	*econ:price*	The change in revenue over last period.
`:delta:profit`	*econ:price*	The change in profit over last period.
`:delta:valuation`	*econ:price*	The change in valuation over last period.
`:delta:population`	*int*	The change in population over last period.

sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

pol:candidate

A candidate for office in a specific race.

The base type for the form can be found at *pol:candidate*.

Properties:

name	type	doc
:contact	*ps:contact*	The contact information of the candidate.
:race	*pol:race*	The race the candidate is participating in.
:campaign	*ou:campaign*	The official campaign to elect the candidate.
:winner	*bool*	Records the outcome of the race.
:party	*ou:org*	The declared political party of the candidate.
:incumbent	*bool*	Set to true if the candidate is an incumbent in this race.

Source Edges:

sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

pol:country

A GUID for a country.

The base type for the form can be found at *pol:country*.

Properties:

name	type	doc	opts
:flag	*file:bytes*	A thumbnail image of the flag of the country.	
:iso2	*pol:iso2*	The 2 digit ISO 3166 country code.	
:iso3	*pol:iso3*	The 3 digit ISO 3166 country code.	
:isonum	*pol:isonum*	The ISO integer country code.	
:pop	*int*	Deprecated. Please use :vitals::population.	Deprecated: True
:tld	*inet:fqdn*	A Fully Qualified Domain Name (FQDN).	
:name	*geo:name*	The name of the country.	
:names	*array* type: *geo:name* uniq: True sorted: True	An array of alternate or localized names for the country.	
:government	*ou:org*	The ou:org node which represents the government of the country.	
:place	*geo:place*	A geo:place node representing the geospatial properties of the country.	
:founded	*time*	The date that the country was founded.	
:dissolved	*time*	The date that the country was dissolved.	
:vitals	*pol:vitals*	The most recent known vitals for the country.	

Source Edges:

meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

pol:immigration:status

A node which tracks the immigration status of a contact.

The base type for the form can be found at *pol:immigration:status*.

Properties:

name	type	doc	opts
:contact	*ps:contact*	The contact information for the immigration status record.	
:country	*pol:country*	The country that the contact is/has immigrated to.	
:type	*pol:immigration:status:*	A taxonomy entry for the immigration status type.	Example: citizen.naturalized
:state	*str* enums: requested, active,rejected, revoked, renounced	The state of the immigration status.	
:began	*time*	The time when the status was granted to the contact.	
:ended	*time*	The time when the status no longer applied to the contact.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.

meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

pol:immigration:status:type:taxonomy

A taxonomy of immigration types.

The base type for the form can be found at *pol:immigration:status:type:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*pol:immigration:status:*	The taxonomy parent.	Read Only: True

Source Edges:

risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

pol:office

An elected or appointed office.

The base type for the form can be found at *pol:office*.

Properties:

name	type	doc	opts
:title	*ou:jobtitl*	The title of the political office.	Example: united states senator
:positio	*ou:positi*	The position this office holds in the org chart for the governing body.	
:termlim	*int*	The maximum number of times a single person may hold the office.	
:govbody	*ou:org*	The governmental body which contains the office.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.

Table 379 – continued from previous page

source	verb	target	doc
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

pol:pollingplace

An official place where ballots may be cast for a specific election.

The base type for the form can be found at *pol:pollingplace*.

Properties:

name	type	doc
:electic	*pol:electic*	The election that the polling place is designated for.
:name	*geo:name*	The name of the polling place at the time of the election. This may differ from the official place name.
:place	*geo:place*	The place where votes were cast.
:opens	*time*	The time that the polling place is scheduled to open.
:closes	*time*	The time that the polling place is scheduled to close.
:opened	*time*	The time that the polling place opened.
:closed	*time*	The time that the polling place closed.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.

Table 380 – continued from previous page

source	verb	target	doc
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

pol:race

An individual race for office.

The base type for the form can be found at *pol:race*.

Properties:

name	type	doc
:election	*pol:election*	The election that includes the race.
:office	*pol:office*	The political office that the candidates in the race are running for.
:voters	*int*	The number of eligible voters for this race.
:turnout	*int*	The number of individuals who voted in this race.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

pol:term

A term in office held by a specific individual.

The base type for the form can be found at *pol:term*.

Properties:

name	type	doc
:office	*pol:office*	The office held for the term.
:start	*time*	The start of the term of office.
:end	*time*	The end of the term of office.
:race	*pol:race*	The race that determined who held office during the term.
:contact	*ps:contact*	The contact information of the person who held office during the term.
:party	*ou:org*	The political party of the person who held office during the term.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

pol:vitals

A set of vital statistics about a country.

The base type for the form can be found at *pol:vitals*.

Properties:

name	type	doc
:country	*pol:country*	The country that the statistics are about.
:asof	*time*	The time that the vitals were measured.
:area	*geo:area*	The area of the country.
:population	*int*	The total number of people living in the country.
:currency	*econ:currency*	The national currency.
:econ:currency	*econ:currency*	The currency used to record price properties.
:econ:gdp	*econ:price*	The gross domestic product of the country.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.

risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

proj:attachment

A file attachment added to a ticket or comment.

The base type for the form can be found at *proj:attachment*.

Properties:

name	type	doc
:name	*file:base*	The name of the file that was attached.
:file	*file:bytes*	The file that was attached.
:creator	*syn:user*	The synapse user who added the attachment.
:created	*time*	The time the attachment was added.
:ticket	*proj:ticket*	The ticket the attachment was added to.
:comment	*proj:comment*	The comment the attachment was added to.

Source Edges:

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

proj:epic

A collection of tickets related to a topic.

The base type for the form can be found at *proj:epic*.

Properties:

name	type	doc
:name	*str* onespace: True	The name of the epic.
:project	*proj:project*	The project containing the epic.
:creator	*syn:user*	The synapse user who created the epic.
:created	*time*	The time the epic was created.
:updated	*time* ismax: True	The last time the epic was updated.

Source Edges:

it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

proj:project:type:taxonomy

A type taxonomy for projects.

The base type for the form can be found at *proj:project:type:taxonomy*.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

proj:sprint

A timeboxed period to complete a set amount of work.

The base type for the form can be found at *proj:sprint*.

Properties:

name	type	doc
:name	*str* lower: True onespace: True	The name of the sprint.
:status	*str* enums: planned,current,completed	The sprint status.
:project	*proj:project*	The project containing the sprint.
:creator	*syn:user*	The synapse user who created the sprint.
:created	*time*	The date the sprint was created.
:period	*ival*	The interval for the sprint.
:desc	*str*	A description of the sprint.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.

source	verb	target	doc
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

proj:ticket

A ticket in a ticketing system.

The base type for the form can be found at *proj:ticket*.

Properties:

name	type	doc
:project	*proj:project*	The project containing the ticket.
:ext:id	*str* strip: `True`	A ticket ID from an external system.
:ext:url	*inet:url*	A URL to the ticket in an external system.
:ext:creator	*ps:contact*	Ticket creator contact information from an external system.
:ext:assignee	*ps:contact*	Ticket assignee contact information from an external system.
:epic	*proj:epic*	The epic that includes the ticket.
:created	*time*	The time the ticket was created.
:updated	*time* ismax: `True`	The last time the ticket was updated.
:name	*str* onespace: `True`	The name of the ticket.
:desc	*str*	A description of the ticket.
:points	*int*	Optional SCRUM style story points value.
:status	*int* enums: `((0, 'new'), (10, 'in validation'), (20, 'in backlog'), (30, 'in sprint'), (40, 'in progress'), (50, 'in review'), (60, 'completed'), (70, 'done'), (80, 'blocked'))`	The ticket completion status.
:sprint	*proj:sprint*	The sprint that contains the ticket.
:priority	*int* enums: `((0, 'none'), (10, 'lowest'), (20, 'low'), (30, 'medium'), (40, 'high'), (50, 'highest'))`	The priority of the ticket.
:type	*str*	The type of ticket. (eg story / bug).

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ps:achievement

An instance of an individual receiving an award.

The base type for the form can be found at *ps:achievement*.

Properties:

name	type	doc
:awardee	*ps:contact*	The recipient of the award.
:award	*ou:award*	The award bestowed on the awardee.
:awarded	*time*	The date the award was granted to the awardee.
:expires	*time*	The date the award or certification expires.
:revoked	*time*	The date the award was revoked by the org.

sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ps:contact

A GUID for a contact info record.

The base type for the form can be found at *ps:contact*.

Properties:

name	type	doc	opts
:org	*ou:org*	The org which this contact represents.	
:type	*ps:contact:type:taxonoi*	The type of contact which may be used for entity resolution.	
:asof	*time*	A date/time value.	date: `The time this contact was created or modified.`
:person	*ps:person*	The ps:person GUID which owns this contact.	
:vitals	*ps:vitals*	The most recent known vitals for the contact.	
:name	*ps:name*	The person name listed for the contact.	
:desc	*str*	A description of this contact.	
:title	*ou:jobtitle*	The job/org title listed for this contact.	
:photo	*file:bytes*	The photo listed for this contact.	
:orgname	*ou:name*	The listed org/company name for this contact.	
:orgfqdn	*inet:fqdn*	The listed org/company FQDN for this contact.	
:user	*inet:user*	The username or handle for this contact.	

continues on next page

Table 392 – continued from previous page

name	type	doc	opts
:web:acct	*inet:web:acct*	The social media account for this contact.	
:web:group	*inet:web:group*	A web group representing this contact.	
:birth:place	*geo:place*	A fully resolved place of birth for this contact.	
:birth:place:loc	*loc*	The loc of the place of birth of this contact.	
:birth:place:name	*geo:name*	The name of the place of birth of this contact.	
:death:place	*geo:place*	A fully resolved place of death for this contact.	
:death:place:loc	*loc*	The loc of the place of death of this contact.	
:death:place:name	*geo:name*	The name of the place of death of this contact.	
:dob	*time*	The date of birth for this contact.	
:dod	*time*	The date of death for this contact.	
:url	*inet:url*	The home or main site for this contact.	
:email	*inet:email*	The main email address for this contact.	
:email:work	*inet:email*	The work email address for this contact.	
:loc	*loc*	Best known contact geopolitical location.	
:address	*geo:address*	The street address listed for the contact.	Display: {'hint': 'text'}
:place	*geo:place*	The place associated with this contact.	
:place:name	*geo:name*	The reported name of the place associated with this contact.	
:phone	*tel:phone*	The main phone number for this contact.	
:phone:fax	*tel:phone*	The fax number for this contact.	
:phone:work	*tel:phone*	The work phone number for this contact.	
:id:number	*ou:id:number*	An ID number issued by an org and associated with this contact.	

continues on next page

Table 392 – continued from previous page

name	type	doc	opts
:adid	*it:adid*	A Advertising ID associated with this contact.	
:imid	*tel:mob:imid*	An IMID associated with the contact.	
:imid:imei	*tel:mob:imei*	An IMEI associated with the contact.	
:imid:imsi	*tel:mob:imsi*	An IMSI associated with the contact.	
:names	*array* type: *ps:name* uniq: True sorted: True	An array of associated names/aliases for the person.	
:orgnames	*array* type: *ou:name* uniq: True sorted: True	An array of associated names/aliases for the organization.	
:emails	*array* type: *inet:email* uniq: True sorted: True	An array of secondary/associated email addresses.	
:web:accts	*array* type: *inet:web:acct* uniq: True sorted: True	An array of secondary/associated web accounts.	
:id:numbers	*array* type: *ou:id:number* uniq: True sorted: True	An array of secondary/associated IDs.	
:users	*array* type: *inet:user* uniq: True sorted: True	An array of secondary/associated user names.	
:crypto:address	*crypto:currency:addres*	A crypto currency address associated with the contact.

risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:softw	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ps:contact:type:taxonomy

A taxonomy of contact types.

The base type for the form can be found at *ps:contact:type:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*ps:contact:type:taxonoı*	The taxonomy parent.	Read Only: True

risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ps:contactlist

A GUID for a list of associated contacts.

The base type for the form can be found at *ps:contactlist*.

Properties:

name	type	doc
:contacts	*array* type: *ps:contact* uniq: True split: , sorted: True	The array of contacts contained in the list.
:source:host	*it:host*	The host from which the contact list was extracted.
:source:file	*file:bytes*	The file from which the contact list was extracted.
:source:acct	*inet:web:acct*	The web account from which the contact list was extracted.

Source Edges:

source	verb	target	doc

it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ps:education

A period of education for an individual.

The base type for the form can be found at *ps:education*.

Properties:

name	type	doc
:student	*ps:contact*	The contact of the person being educated.
:institution	*ps:contact*	The contact info for the org providing educational services.
:attended:first	*time*	The first date the student attended a class.
:attended:last	*time*	The last date the student attended a class.
:classes	*array* type: *edu:class* uniq: True sorted: True	The classes attended by the student.
:achievement	*ps:achievement*	The achievement awarded to the individual.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.

source	verb	target	doc
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ps:name

An arbitrary, lower spaced string with normalized whitespace.

The base type for the form can be found at *ps:name*.

An example of `ps:name`:

- `robert grey`

Properties:

name	type	doc
:sur	*ps:tokn*	The surname part of the name.
:middle	*ps:tokn*	The middle name part of the name.
:given	*ps:tokn*	The given name part of the name.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ps:person

A GUID for a person.

The base type for the form can be found at *ps:person*.

Properties:

name	type	doc	opts
:dob	*time*	The date on which the person was born.	
:dod	*time*	The date on which the person died.	
:img	*file:bytes*	Deprecated: use ps:person:photo.	Deprecated: True
:photo	*file:bytes*	The primary image of a person.	
:nick	*inet:user*	A username commonly used by the person.	
:vitals	*ps:vitals*	The most recent known vitals for the person.	
:name	*ps:name*	The localized name for the person.	
:name:sur	*ps:tokn*	The surname of the person.	
:name:middle	*ps:tokn*	The middle name of the person.	
:name:given	*ps:tokn*	The given name of the person.	
:names	*array* type: *ps:name* uniq: True sorted: True	Variations of the name for the person.	
:nicks	*array* type: *inet:user* uniq: True sorted: True	Usernames used by the person.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremer	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat):	geo:telem	The source node was seen at the geo:telem node place and time.
ps:persoı	-(has)>	*	The person is or was in possession of the target node.
ps:persoı	-(owns)>	*	The person owns or owned the target node.

Target Edges:

source	verb	target	doc

it:app:snort:ru	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rul	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise.
risk:extortion	-(leveraged	*	The extortion event was based on attacker access to the target node.
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:softw	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ps:person:has

A person owns, controls, or has exclusive use of an object or resource, potentially during a specific period of time.

The base type for the form can be found at *ps:person:has*.

Properties:

name	type	doc	opts
:person	*ps:persoi*	The person who owns or controls the object or resource.	Read Only: True
:node	*ndef*	The object or resource that is owned or controlled by the person.	Read Only: True
:node:for	*str*	The form of the object or resource that is owned or controlled by the person.	Read Only: True

Source Edges:

source	verb	target	doc

sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ps:persona

A GUID for a suspected person.

The base type for the form can be found at *ps:persona*.

Properties:

name	type	doc
:person	*ps:person*	The real person behind the persona.
:dob	*time*	The Date of Birth (DOB) if known.
:img	*file:bytes*	The primary image of a suspected person.
:nick	*inet:user*	A username commonly used by the suspected person.
:name	*ps:name*	The localized name for the suspected person.
:name:sur	*ps:tokn*	The surname of the suspected person.
:name:middle	*ps:tokn*	The middle name of the suspected person.
:name:given	*ps:tokn*	The given name of the suspected person.
:names	*array* type: *ps:name* uniq: True sorted: True	Variations of the name for a persona.

ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ps:skill:type:taxonomy

A taxonomy of skill types.

The base type for the form can be found at *ps:skill:type:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: `True` Display: `{'hint': 'text'}`
:desc	*str*	A definition of the taxonomy entry.	Display: `{'hint': 'text'}`
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: `True`
:depth	*int*	The depth indexed from 0.	Read Only: `True`
:parent	*ps:skill:type:taxonomy*	The taxonomy parent.	Read Only: `True`

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.

source	verb	target	doc
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ps:tokn

A single name element (potentially given or sur).

The base type for the form can be found at *ps:tokn*.

An example of `ps:tokn`:

- `robert`

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ps:vitals

Statistics and demographic data about a person or contact.

The base type for the form can be found at *ps:vitals*.

Properties:

name	type	doc
:asof	*time*	The time the vitals were gathered or computed.
:contact	*ps:contact*	The contact that the vitals are about.
:person	*ps:person*	The person that the vitals are about.
:height	*geo:dist*	The height of the person or contact.
:weight	*mass*	The weight of the person or contact.
:econ:currency	*econ:currency*	The currency that the price values are recorded using.
:econ:net:worth	*econ:price*	The net worth of the contact.
:econ:annual:income	*econ:price*	The yearly income of the contact.

Source Edges:

econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

ps:workhist

A GUID representing entry in a contact's work history.

The base type for the form can be found at *ps:workhist*.

Properties:

name	type	doc
:contact	*ps:contact*	The contact which has the work history.
:org	*ou:org*	The org that this work history orgname refers to.
:orgname	*ou:name*	The reported name of the org the contact worked for.
:orgfqdn	*inet:fqdn*	The reported fqdn of the org the contact worked for.
:jobtype	*ou:jobtype*	The type of job.
:employment	*ou:employment*	The type of employment.
:jobtitle	*ou:jobtitle*	The job title.
:started	*time*	The date that the contact began working.
:ended	*time*	The date that the contact stopped working.
:duration	*duration*	The duration of the period of work.
:pay	*econ:price*	The estimated/average yearly pay for the work.
:currency	*econ:currency*	The currency that the yearly pay was delivered in.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc

sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:alert

An instance of an alert which indicates the presence of a risk.

The base type for the form can be found at *risk:alert*.

Properties:

name	type	doc	opts
:type	*risk:alert:taxonomy*	A type for the alert, as a taxonomy entry.	
:name	*str*	A brief name for the alert.	
:desc	*str*	A free-form description / overview of the alert.	Display: {'hint': 'text'}
:status	*int* enums: ((0, 'new'), (10, 'enrichment'), (20, 'todo'), (30, 'analysis'), (40, 'remediation'), (50, 'done'))	The status of the alert.	
:benign	*bool*	Set to true if the alert has been confirmed benign. Set to false if malicious.	
:priority	*meta:priority*	A priority rank for the alert.	
:severity	*meta:severity*	A severity rank for the alert.	
:verdict	*risk:alert:verdict:taxon*	A verdict about why the alert is malicious or benign, as a taxonomy entry.	Example: benign.false_positive
:assignee	*syn:user*	The Synapse user who is assigned to investigate the alert.	
:ext:assignee	*ps:contact*	The alert assignee contact information from an external system.	
:engine	*it:prod:softver*	The software that generated the alert.	
:detected	*time*	The time the alerted condition was detected.	
:vuln	*risk:vuln*	The optional vulnerability that the alert indicates.	
:attack	*risk:attack*	A confirmed attack that this alert indicates.	
:url	*inet:url*	A URL which documents the alert.	
:ext:id	*str*	An external identifier for the alert.	
:host	*it:host*	The host which generated the alert.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:attack

An instance of an actor attacking a target.

The base type for the form can be found at *risk:attack*.

Properties:

name	type	doc	opts
:desc	*str*	A description of the attack.	Display: {'hint': 'text'}
:type	*risk:attacktype*	A type for the attack, as a taxonomy entry.	Example: cno.phishing
:reporter	*ou:org*	The organization reporting on the attack.	
:reporter:name	*ou:name*	The name of the organization reporting on the attack.	
:time	*time*	Set if the time of the attack is known.	
:detected	*time*	The first confirmed detection time of the attack.	
:success	*bool*	Set if the attack was known to have succeeded or not.	
:targeted	*bool*	Set if the attack was assessed to be targeted or not.	
:goal	*ou:goal*	The tactical goal of this specific attack.	
:campaign	*ou:campaign*	Set if the attack was part of a larger campaign.	
:compromise	*risk:compromise*	A compromise that this attack contributed to.	
:severity	*meta:severity*	A severity rank for the attack.	
:sophistication	*meta:sophistication*	The assessed sophistication of the attack.	
:prev	*risk:attack*	The previous/parent attack in a list or hierarchy.	
:actor:org	*ou:org*	Deprecated. Please use :attacker to allow entity resolution.	Deprecated: True
:actor:person	*ps:person*	Deprecated. Please use :attacker to allow entity resolution.	Deprecated: True
:attacker	*ps:contact*	Contact information representing the attacker.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:compromise

An instance of a compromise and its aggregate impact.

The base type for the form can be found at *risk:compromise*.

Properties:

name	type	doc	opts
:name	*str* lower: True onespace: True	A brief name for the compromise event.	
:desc	*str*	A prose description of the compromise event.	Display: {'hint': 'text'}
:reporter	*ou:org*	The organization reporting on the compromise.	
:reporter:name	*ou:name*	The name of the organization reporting on the compromise.	
:ext:id	*str*	An external unique ID for the compromise.	
:url	*inet:url*	A URL which documents the compromise.	
:type	*risk:compromisetype*	A type for the compromise, as a taxonomy entry.	Example: cno.breach
:vector	*risk:attack*	The attack assessed to be the initial compromise vector.	
:target	*ps:contact*	Contact information representing the target.	
:attacker	*ps:contact*	Contact information representing the attacker.	
:campaign	*ou:campaign*	The campaign that this compromise is part of.	
:time	*time*	Earliest known evidence of compromise.	
:lasttime	*time*	Last known evidence of compromise.	
:duration	*duration*	The duration of the compromise.	
:detected	*time*	The first confirmed detection time of the compromise.	
:loss:pii	*int*	The number of records compromised which contain PII.	
:loss:econ	*econ:price*	The total economic cost of the compromise.	
:loss:life	*int*	The total loss of life due to the compromise.	
:loss:bytes	*int*	An estimate of the volume of data compromised.	
:ransom:paid	*econ:price*	The value of the ransom paid by the target.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.
risk:comprom:	-(stole)>	*	The target node was stolen or copied as a result of the compromise.
risk:comprom:	-(uses)>	ou:technique	The attacker used the technique in the compromise.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:compromisetype

A taxonomy of compromise types.

The base type for the form can be found at *risk:compromisetype*.

An example of `risk:compromisetype`:

- `cno.breach`

Properties:

name	type	doc	opts
`:title`	*str*	A brief title of the definition.	
`:summary`	*str*	Deprecated. Please use title/desc.	Deprecated: `True` Display: `{'hint': 'text'}`
`:desc`	*str*	A definition of the taxonomy entry.	Display: `{'hint': 'text'}`
`:sort`	*int*	A display sort order for siblings.	
`:base`	*taxon*	The base taxon.	Read Only: `True`
`:depth`	*int*	The depth indexed from 0.	Read Only: `True`
`:parent`	*risk:compromisetype*	The taxonomy parent.	Read Only: `True`

Source Edges:

source	verb	target	doc
`*`	`-(meets)>`	`ou:requireme`	The requirement is met by the source node.
`*`	`-(refs)>`	`*`	The source node contains a reference to the target node.
`*`	`-(seenat)`	`geo:telem`	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
`*`	`-(refs)>`	`*`	None
`econ:purchase`	`-(acquired)>`	`*`	The purchase was used to acquire the target node.
`it:app:snort:rule`	`-(detects)>`	`*`	The snort rule is intended for use in detecting the target node.
`it:app:yara:rule`	`-(detects)>`	`*`	The YARA rule is intended for use in detecting the target nod
`it:exec:query`	`-(found)>`	`*`	The target node was returned as a result of running the query.
`meta:note`	`-(about)>`	`*`	The meta:note is about the target node.

Table 413 – continued from previous page

source	verb	target	doc
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:extortion

An event where an attacker attempted to extort a victim.

The base type for the form can be found at *risk:extortion*.

Properties:

name	type	doc	opts
:name	*str* lower: True onespace: True	A name for the extortion event.	
:desc	*str*	A description of the extortion event.	Display: {'hint': 'text'}
:reporter	*ou:org*	The organization reporting on the extortion event.	
:reporter:name	*ou:name*	The name of the organization reporting on the extortion event.	
:demanded	*time*	The time that the attacker made their demands.	
:deadline	*time*	The time that the demand must be met.	
:goal	*ou:goal*	The goal of the attacker in extorting the victim.	
:type	*risk:extortion:type:taxo*	A type taxonomy for the extortion event.	
:attacker	*ps:contact*	The extortion attacker identity.	
:target	*ps:contact*	The extortion target identity.	
:success	*bool*	Set to true if the victim met the attacker's demands.	
:enacted	*bool*	Set to true if attacker carried out the threat.	
:public	*bool*	Set to true if the attacker publicly announced the extortion.	
:public:url	*inet:url*	The URL where the attacker publicly announced the extortion.	
:compromise	*risk:compromise*	The compromise which allowed the attacker to extort the target.	
:demanded:payment:	*econ:price*	The payment price which was demanded.	
:demanded:payment:	*econ:currency*	The currency in which payment was demanded.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requirem	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise.
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:extortion:type:taxonomy

A taxonomy of extortion event types.

The base type for the form can be found at *risk:extortion:type:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*risk:extortion:type:taxc*	The taxonomy parent.	Read Only: True

Source Edges:

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:leak

An event where information was disclosed without permission.

The base type for the form can be found at *risk:leak*.

Properties:

name	type	doc	opts
:name	*str* lower: True onespace: True	A simple name for the leak event.	
:desc	*str*	A description of the leak event.	Display: {'hint': 'text'}
:reporter	*ou:org*	The organization reporting on the leak event.	
:reporter:name	*ou:name*	The name of the organization reporting on the leak event.	
:disclosed	*time*	The time the leaked information was disclosed.	
:owner	*ps:contact*	The owner of the leaked information.	
:leaker	*ps:contact*	The identity which leaked the information.	
:type	*risk:leak:type:taxonom*	A type taxonomy for the leak.	
:goal	*ou:goal*	The goal of the leaker in disclosing the information.	
:compromise	*risk:compromise*	The compromise which allowed the leaker access to the information.	
:extortion	*risk:extortion*	The extortion event which used the threat of the leak as leverage.	
:public	*bool*	Set to true if the leaked information was made publicly available.	
:public:url	*inet:url*	The URL where the leaked information was made publicly available.	
:size:bytes	*int* min: 0	The approximate uncompressed size of the total data leaked.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremer	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat):	geo:telem	The source node was seen at the geo:telem node place and time.
risk:leal	-(leaked):	*	The leak included the disclosure of the target node.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:leak:type:taxonomy

A taxonomy of leak event types.

The base type for the form can be found at *risk:leak:type:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*risk:leak:type:taxonom*	The taxonomy parent.	Read Only: True

ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:mitigation

A mitigation for a specific risk:vuln.

The base type for the form can be found at *risk:mitigation*.

Properties:

name	type	doc	opts
:vuln	*risk:vuln*	The vulnerability that this mitigation addresses.	
:name	*str* lower: True onespace: True	A brief name for this risk mitigation.	
:desc	*str*	A description of the mitigation approach for the vulnerability.	Display: {'hint': 'text'}
:software	*it:prod:softver*	A software version which implements a fix for the vulnerability.	
:hardware	*it:prod:hardware*	A hardware version which implements a fix for the vulnerability.	
:reporter	*ou:org*	The organization reporting on the mitigation.	
:reporter:name	*ou:name*	The name of the organization reporting on the mitigation.	
:mitre:attack:miti	*it:mitre:attack:mitigatic*	A mapping to a MITRE ATT&CK mitigation if applicable.	
:tag	*syn:tag*	The tag used to annotate nodes which have the mitigation in place.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.
risk:mitigat	-(addresses	ou:technique	The mitigation addresses the technique.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.

risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:technique:masquerade

Represents the assessment that a node is designed to resemble another in order to mislead.

The base type for the form can be found at *risk:technique:masquerade*.

Properties:

name	type	doc
:node	*ndef*	The node masquerading as another.
:period	*ival*	The time period when the masquerading was active.
:target	*ndef*	The being masqueraded as.
:technique	*ou:technique*	The specific technique which describes the type of masquerading.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:threat

A threat cluster or subgraph of threat activity, as reported by a specific organization.

The base type for the form can be found at *risk:threat*.

Properties:

name	type	doc	opts
:name	*str* lower: `True` onespace: `True`	A brief descriptive name for the threat cluster.	Example: `apt1 (mandiant)`
:type	*risk:threat:type:taxonoi*	A type for the threat, as a taxonomy entry.	
:desc	*str*	A description of the threat cluster.	
:tag	*syn:tag*	The tag used to annotate nodes that are associated with the threat cluster.	
:active	*ival*	An interval for when the threat cluster is assessed to have been active.	
:reporter	*ou:org*	The organization reporting on the threat cluster.	
:reporter:name	*ou:name*	The name of the organization reporting on the threat cluster.	
:reporter:discover	*time*	The time that the reporting organization first discovered the threat cluster.	
:reporter:publishe	*time*	The time that the reporting organization first publicly disclosed the threat cluster.	
:org	*ou:org*	The authoritative organization for the threat cluster.	
:org:loc	*loc*	The reporting organization's assessed location of the threat cluster.	
:org:name	*ou:name*	The reporting organization's name for the threat cluster.	Example: `apt1`
:org:names	*array* type: *ou:name* sorted: `True` uniq: `True`	An array of alternate names for the threat cluster, according to the reporting organization.	
:country	*pol:country*	The reporting organization's assessed country of origin of the threat cluster.	
:country:code	*pol:iso2*	The 2 digit ISO 3166 country code for the threat cluster's assessed country of	

Source Edges:

source	verb	target	doc

it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise.
risk:extortion	-(leveraged	*	The extortion event was based on attacker access to the target node.
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:tool:softw	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:threat:type:taxonomy

A taxonomy of threat types.

The base type for the form can be found at *risk:threat:type:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*risk:threat:type:taxono*	The taxonomy parent.	Read Only: True

Source Edges:

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:tool:software

A software tool used in threat activity, as reported by a specific organization.

The base type for the form can be found at *risk:tool:software*.

Properties:

name	type	doc	opts
:tag	*syn:tag*	The tag used to annotate nodes that are associated with the tool.	Example: `rep.mandiant.tabcteng`
:desc	*str*	A description of the tool.	
:type	*risk:tool:software:taxon*	A type for the tool, as a taxonomy entry.	
:used	*ival*	An interval for when the tool is assessed to have been deployed.	
:availability	*risk:availability*	The reporting organization's assessed availability of the tool.	
:sophistication	*meta:sophistication*	The reporting organization's assessed sophistication of the tool.	
:reporter	*ou:org*	The organization reporting on the tool.	
:reporter:name	*ou:name*	The name of the organization reporting on the tool.	
:reporter:discovered	*time*	The time that the reporting organization first discovered the tool.	
:reporter:published	*time*	The time that the reporting organization first publicly disclosed the tool.	
:soft	*it:prod:soft*	The authoritative software family for the tool.	
:soft:name	*it:prod:softname*	The reporting organization's name for the tool.	
:soft:names	*array* type: *it:prod:softname* uniq: `True` sorted: `True`	An array of alternate names for the tool, according to the reporting organization.	
:techniques	*array* type: *ou:technique* uniq: `True` sorted: `True`	Deprecated for scalability. Please use -(uses)> ou:technique.	Deprecated: `True`
:mitre:attack:software	*it:mitre:attack:software*	A mapping to a MITRE ATT&CK software if applicable.

*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise.
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node.
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:tool:software:taxonomy

A taxonomy of software / tool types.

The base type for the form can be found at *risk:tool:software:taxonomy*.

Properties:

name	type	doc	opts
:title	*str*	A brief title of the definition.	
:summary	*str*	Deprecated. Please use title/desc.	Deprecated: True Display: {'hint': 'text'}
:desc	*str*	A definition of the taxonomy entry.	Display: {'hint': 'text'}
:sort	*int*	A display sort order for siblings.	
:base	*taxon*	The base taxon.	Read Only: True
:depth	*int*	The depth indexed from 0.	Read Only: True
:parent	*risk:tool:software:taxoı*	The taxonomy parent.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:vuln

A unique vulnerability.

The base type for the form can be found at *risk:vuln*.

Properties:

name	type	doc	opts
:name	*risk:vulnname*	A user specified name for the vulnerability.	
:names	*array* type: *risk:vulnname* sorted: True uniq: True	An array of alternate names for the vulnerability.	
:type	*risk:vuln:type:taxonom*	A taxonomy type entry for the vulnerability.	
:desc	*str*	A description of the vulnerability.	Display: {'hint': 'text'}
:severity	*meta:severity*	The severity of the vulnerability.	
:priority	*meta:priority*	The priority of the vulnerability.	
:reporter	*ou:org*	The organization reporting on the vulnerability.	

continues on next page

Table 424 – continued from previous page

name	type	doc	opts
:reporter:name	*ou:name*	The name of the organization reporting on the vulnerability.	
:mitigated	*bool*	Set to true if a mitigation/fix is available for the vulnerability.	
:exploited	*bool*	Set to true if the vulnerability has been exploited in the wild.	
:timeline:discover	*time* ismin: `True`	The earliest known discovery time for the vulnerability.	
:timeline:publishe	*time* ismin: `True`	The earliest known time the vulnerability was published.	
:timeline:vendor:n	*time* ismin: `True`	The earliest known vendor notification time for the vulnerability.	
:timeline:vendor:f	*time* ismin: `True`	The earliest known time the vendor issued a fix for the vulnerability.	
:timeline:exploite	*time* ismin: `True`	The earliest known time when the vulnerability was exploited in the wild.	
:id	*str* strip: `True`	An identifier for the vulnerability.	
:cve	*it:sec:cve*	The CVE ID of the vulnerability.	
:cve:desc	*str*	The description of the vulnerability according to the CVE database.	Display: `{'hint': 'text'}`
:cve:url	*inet:url*	A URL linking this vulnerability to the CVE description.	
:cve:references	*array* type: *inet:url* uniq: `True` sorted: `True`	An array of documentation URLs provided by the CVE database.

sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

risk:vulnerable

Indicates that a node is susceptible to a vulnerability.

The base type for the form can be found at *risk:vulnerable*.

Properties:

name	type	doc
:vuln	*risk:vuln*	The vulnerability that the node is susceptible to.
:period	*ival*	The time window where the node was vulnerable.
:node	*ndef*	The node which is vulnerable.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

rsa:key

An RSA keypair modulus and public exponent.

The base type for the form can be found at *rsa:key*.

Properties:

name	type	doc	opts
:mod	*hex*	The RSA key modulus.	Read Only: True
:pub:exp	*int*	The public exponent of the key.	Read Only: True
:bits	*int*	The length of the modulus in bits.	
:priv:exp	*hex*	The private exponent of the key.	
:priv:p	*hex*	One of the two private primes.	
:priv:q	*hex*	One of the two private primes.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

sci:evidence

An assessment of how an observation supports or refutes a hypothesis.

The base type for the form can be found at *sci:evidence*.

Properties:

name	type	doc	opts
:hypothe:	*sci:experin*	The hypothesis which the evidence supports or refutes.	
:observa	*sci:observ*	The observation which supports or refutes the hypothesis.	
:summary	*str*	A summary of how the observation supports or refutes the hypothesis.	Display: {'hint': 'text'}
:refutes	*bool*	Set to true if the evidence refutes the hypothesis or false if it supports the hypothesis.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.
sci:evidenc	-(has)>	*	The evidence includes observations from the target nodes.

Target Edges:

source	verb	target	doc

ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

sci:experiment

An instance of running an experiment.

The base type for the form can be found at *sci:experiment*.

Properties:

name	type	doc	opts
:name	*str* lower: True onespace: True	The name of the experiment.	
:summary	*str*	A summary of the experiment.	Display: {'hint': 'text'}
:time	*time*	The time when the experiment was initiated.	
:type	*sci:experiment:type:tax*	The type of experiment as a user defined taxonomy.	
:window	*ival*	The time window where the experiment was run.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.

risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

syn:cron

A Cortex cron job.

The base type for the form can be found at *syn:cron*.

Properties:

name	type	doc	opts
:doc	*str*	A description of the cron job.	Display: {'hint': 'text'}
:name	*str*	A user friendly name/alias for the cron job.	
:storm	*str*	The storm query executed by the cron job.	Read Only: True Display: {'hint': 'text'}

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

syn:form

A Synapse form used for representing nodes in the graph.

The base type for the form can be found at *syn:form*.

Properties:

name	type	doc	opts
:doc	*str* strip: True	The docstring for the form.	Read Only: True
:type	*syn:type*	Synapse type for this form.	Read Only: True
:runt	*bool*	Whether or not the form is runtime only.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.

source	verb	target	doc
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

syn:prop

A Synapse property.

The base type for the form can be found at *syn:prop*.

Properties:

name	type	doc	opts
:doc	*str* strip: True	Description of the property definition.	
:form	*syn:form*	The form of the property.	Read Only: True
:type	*syn:type*	The synapse type for this property.	Read Only: True
:relname	*str* strip: True	Relative property name.	Read Only: True
:univ	*bool*	Specifies if a prop is universal.	Read Only: True
:base	*str* strip: True	Base name of the property.	Read Only: True
:ro	*bool*	If the property is read-only after being set.	Read Only: True
:extmodel	*bool*	If the property is an extended model property or not.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

syn:tag

The base type for a synapse tag.

The base type for the form can be found at *syn:tag*.

Properties:

name	type	doc	opts
:up	*syn:tag*	The parent tag for the tag.	Read Only: True
:isnow	*syn:tag*	Set to an updated tag if the tag has been renamed.	
:doc	*str*	A short definition for the tag.	Display: {'hint': 'text'}
:doc:url	*inet:url*	A URL link to additional documentation about the tag.	
:depth	*int*	How deep the tag is in the hierarchy.	Read Only: True
:title	*str*	A display title for the tag.	
:base	*str*	The tag base name. Eg baz for foo.bar.baz .	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.

meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

syn:trigger

A Cortex trigger.

The base type for the form can be found at *syn:trigger*.

Properties:

name	type	doc	opts
:vers	*int*	Trigger version.	Read Only: True
:doc	*str*	A documentation string describing the trigger.	Display: {'hint': 'text'}
:name	*str*	A user friendly name/alias for the trigger.	
:cond	*str* strip: True lower: True	The trigger condition.	Read Only: True
:user	*str*	User who owns the trigger.	Read Only: True
:storm	*str*	The Storm query for the trigger.	Read Only: True Display: {'hint': 'text'}
:enabled	*bool*	Trigger enabled status.	Read Only: True
:form	*str* lower: True strip: True	Form the trigger is watching for.	
:verb	*str* lower: True strip: True	Edge verb the trigger is watching for.	
:n2form	*str* lower: True strip: True	N2 form the trigger is watching for.	
:prop	*str* lower: True strip: True	Property the trigger is watching for.	
:tag	*str* lower: True strip: True	Tag the trigger is watching for.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.

it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

syn:type

A Synapse type used for normalizing nodes and properties.

The base type for the form can be found at *syn:type*.

Properties:

name	type	doc	opts
:doc	*str* strip: True	The docstring for the type.	Read Only: True
:ctor	*str* strip: True	The python ctor path for the type object.	Read Only: True
:subof	*syn:type*	Type which this inherits from.	Read Only: True
:opts	*data*	Arbitrary type options.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

tel:call

A guid for a telephone call record.

The base type for the form can be found at *tel:call*.

Properties:

name	type	doc	opts
:src	*tel:phone*	The source phone number for a call.	
:dst	*tel:phone*	The destination phone number for a call.	
:time	*time*	The time the call was initiated.	
:duration	*int*	The duration of the call in seconds.	
:connected	*bool*	Indicator of whether the call was connected.	
:text	*str*	The text transcription of the call.	Display: {'hint': 'text'}
:file	*file:bytes*	A file containing related media.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

tel:mob:carrier

The fusion of a MCC/MNC.

The base type for the form can be found at *tel:mob:carrier*.

Properties:

name	type	doc	opts
:mcc	*tel:mob:mcc*	ITU Mobile Country Code.	Read Only: True
:mnc	*tel:mob:mnc*	ITU Mobile Network Code.	Read Only: True
:org	*ou:org*	Organization operating the carrier.	
:loc	*loc*	Location the carrier operates from.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

tel:mob:cell

A mobile cell site which a phone may connect to.

The base type for the form can be found at *tel:mob:cell*.

Properties:

name	type	doc	opts
:carrier	*tel:mob:carrier*	Mobile carrier.	Read Only: True
:carrier:mcc	*tel:mob:mcc*	Mobile Country Code.	Read Only: True
:carrier:mnc	*tel:mob:mnc*	Mobile Network Code.	Read Only: True
:lac	*int*	Location Area Code. LTE networks may call this a TAC.	Read Only: True
:cid	*int*	The Cell ID.	Read Only: True
:radio	*str* lower: 1 onespace: 1	Cell radio type.	
:latlong	*geo:latlong*	Last known location of the cell site.	
:loc	*loc*	Location at which the cell is operated.	
:place	*geo:place*	The place associated with the latlong property.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target node.
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target node.

meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

tel:mob:imei

An International Mobile Equipment Id.

The base type for the form can be found at *tel:mob:imei*.

An example of `tel:mob:imei`:

- `490154203237518`

Properties:

name	type	doc	opts
:tac	*tel:mob:tac*	The Type Allocate Code within the IMEI.	Read Only: True
:serial	*int*	The serial number within the IMEI.	Read Only: True

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.

it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

tel:mob:imid

Fused knowledge of an IMEI/IMSI used together.

The base type for the form can be found at *tel:mob:imid*.

An example of `tel:mob:imid`:

- `(490154203237518, 310150123456789)`

Properties:

name	type	doc	opts
:imei	*tel:mob:imei*	The IMEI for the phone hardware.	Read Only: True
:imsi	*tel:mob:imsi*	The IMSI for the phone subscriber.	Read Only: True

Source Edges:

tel:mob:tac

A mobile Type Allocation Code.

The base type for the form can be found at *tel:mob:tac*.

An example of `tel:mob:tac`:

- `49015420`

Properties:

name	type	doc
`:org`	*ou:org*	The org guid for the manufacturer.
`:manu`	*str* lower: 1	The TAC manufacturer name.
`:model`	*str* lower: 1	The TAC model name.
`:internal`	*str* lower: 1	The TAC internal model name.

Source Edges:

source	verb	target	doc
`*`	`-(meets)>`	`ou:requireme`	The requirement is met by the source node.
`*`	`-(refs)>`	`*`	The source node contains a reference to the target node.
`*`	`-(seenat)`	`geo:telem`	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
`*`	`-(refs)>`	`*`	None
`econ:purchase`	`-(acquired)>`	`*`	The purchase was used to acquire the target node.
`it:app:snort:rule`	`-(detects)>`	`*`	The snort rule is intended for use in detecting the target node.
`it:app:yara:rule`	`-(detects)>`	`*`	The YARA rule is intended for use in detecting the target nod
`it:exec:query`	`-(found)>`	`*`	The target node was returned as a result of running the query.
`meta:note`	`-(about)>`	`*`	The meta:note is about the target node.
`meta:rule`	`-(detects)>`	`*`	The meta:rule is designed to detect instances of the target nod
`meta:rule`	`-(matches)>`	`*`	The meta:rule has matched on target node.
`meta:source`	`-(seen)>`	`*`	The meta:source observed the target node.

risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

tel:mob:telem

A single mobile telemetry measurement.

The base type for the form can be found at *tel:mob:telem*.

Properties:

name	type	doc
:time	*time*	A date/time value.
:latlong	*geo:latlong*	A Lat/Long string specifying a point on Earth.
:http:request	*inet:http:request*	The HTTP request that the telemetry was extracted from.
:host	*it:host*	The host that generated the mobile telemetry data.
:place	*geo:place*	The place representing the location of the mobile telemetry sample.
:loc	*loc*	The geo-political location of the mobile telemetry sample.
:accuracy	*geo:dist*	The reported accuracy of the latlong telemetry reading.
:cell	*tel:mob:cell*	A mobile cell site which a phone may connect to.
:cell:carrier	*tel:mob:carrier*	The fusion of a MCC/MNC.
:imsi	*tel:mob:imsi*	An International Mobile Subscriber Id.
:imei	*tel:mob:imei*	An International Mobile Equipment Id.
:phone	*tel:phone*	A phone number.
:mac	*inet:mac*	A 48-bit Media Access Control (MAC) address.
:ipv4	*inet:ipv4*	An IPv4 address.
:ipv6	*inet:ipv6*	An IPv6 address.
:wifi	*inet:wifi:ap*	An SSID/MAC address combination for a wireless access point.
:wifi:ssid	*inet:wifi:ssid*	A WiFi service set identifier (SSID) name.
:wifi:bssid	*inet:mac*	A 48-bit Media Access Control (MAC) address.
:adid	*it:adid*	An advertising identification string.
:aaid	*it:os:android:aaid*	An android advertising identification string.
:idfa	*it:os:ios:idfa*	An iOS advertising identification string.
:name	*ps:name*	An arbitrary, lower spaced string with normalized whitespace.
:email	*inet:email*	An e-mail address.
:acct	*inet:web:acct*	An account with a given Internet-based site or service.
:app	*it:prod:softver*	A specific version of a software product.
:data	*data*	Arbitrary json compatible data.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requirement	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compromise
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target node
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

tel:phone

A phone number.

The base type for the form can be found at *tel:phone*.

An example of `tel:phone`:

- `+15558675309`

Properties:

name	type	doc
:loc	*loc*	The location associated with the number.

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requireme	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

source	verb	target	doc
*	-(refs)>	*	None
econ:purchase	-(acquired)>	*	The purchase was used to acquire the target node.
it:app:snort:rule	-(detects)>	*	The snort rule is intended for use in detecting the target node.
it:app:yara:rule	-(detects)>	*	The YARA rule is intended for use in detecting the target nod
it:exec:query	-(found)>	*	The target node was returned as a result of running the query.
meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

tel:txtmesg

A guid for an individual text message.

The base type for the form can be found at *tel:txtmesg*.

Properties:

name	type	doc	opts
:from	*tel:phone*	The phone number assigned to the sender.	
:to	*tel:phone*	The phone number assigned to the primary recipient.	
:recipients	*array* type: *tel:phone* uniq: True sorted: True	An array of phone numbers for additional recipients of the message.	
:svctype	*str* enums: sms,mms,rcs strip: 1 lower: 1	The message service type (sms, mms, rcs).	
:time	*time*	The time the message was sent.	
:text	*str*	The text of the message.	Display: {'hint': 'text'}
:file	*file:bytes*	A file containing related media.	

Source Edges:

source	verb	target	doc
*	-(meets)>	ou:requiremen	The requirement is met by the source node.
*	-(refs)>	*	The source node contains a reference to the target node.
*	-(seenat)>	geo:telem	The source node was seen at the geo:telem node place and time.

Target Edges:

sci:observation	-(has)>	*	The observations are summarized from the target nodes.

transport:air:flight

An individual instance of a flight.

The base type for the form can be found at *transport:air:flight*.

Properties:

name	type	doc
:num	*transport:air:flightnum*	The flight number of this flight.
:scheduled:departure	*time*	The time this flight was originally scheduled to depart.
:scheduled:arrival	*time*	The time this flight was originally scheduled to arrive.
:departed	*time*	The time this flight departed.
:arrived	*time*	The time this flight arrived.
:carrier	*ou:org*	The org which operates the given flight number.
:craft	*transport:air:craft*	The aircraft that flew this flight.
:tailnum	*transport:air:tailnum*	The tail/registration number at the time the aircraft flew this flight.
:to:port	*transport:air:port*	The destination airport of this flight.
:from:port	*transport:air:port*	The origin airport of this flight.
:stops	*array* type: *transport:air:port*	An ordered list of airport codes for stops which occurred during this flight.
:cancelled	*bool*	Set to true for cancelled flights.

Source Edges:

transport:air:flightnum

A commercial flight designator including airline and serial.

The base type for the form can be found at *transport:air:flightnum*.

An example of `transport:air:flightnum`:

- `ua2437`

Properties:

name	type	doc
:carrier	*ou:org*	The org which operates the given flight number.
:to:port	*transport:air:port*	The most recently registered destination for the flight number.
:from:port	*transport:air:port*	The most recently registered origin for the flight number.
:stops	*array* type: *transport:air:port*	An ordered list of aiport codes for the flight segments.

Source Edges:

meta:note	-(about)>	*	The meta:note is about the target node.
meta:rule	-(detects)>	*	The meta:rule is designed to detect instances of the target nod
meta:rule	-(matches)>	*	The meta:rule has matched on target node.
meta:source	-(seen)>	*	The meta:source observed the target node.
ou:campaign	-(targets)>	*	The campaign targeted the target nodes.
ou:campaign	-(uses)>	*	The campaign made use of the target node.
ou:contribution	-(includes)>	*	The contribution includes the specific node.
ou:org	-(has)>	*	The organization is or was in possession of the target node.
ou:org	-(owns)>	*	The organization owns or owned the target node.
ou:org	-(targets)>	*	The organization targets the target node.
ou:org	-(uses)>	*	The ou:org makes use of the target node.
ps:contact	-(has)>	*	The contact is or was in possession of the target node.
ps:contact	-(owns)>	*	The contact owns or owned the target node.
ps:person	-(has)>	*	The person is or was in possession of the target node.
ps:person	-(owns)>	*	The person owns or owned the target node.
risk:attack	-(targets)>	*	The attack targeted the target node.
risk:attack	-(uses)>	*	The attack used the target node to facilitate the attack.
risk:compromise	-(stole)>	*	The target node was stolen or copied as a result of the compro
risk:extortion	-(leveraged)>	*	The extortion event was based on attacker access to the target
risk:leak	-(leaked)>	*	The leak included the disclosure of the target node.
risk:threat	-(targets)>	*	The threat cluster targeted the target node.

source	verb	target	doc
risk:threat	-(uses)>	*	The threat cluster uses the target node.
risk:tool:software	-(uses)>	*	The tool uses the target node.
sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

transport:air:telem

A telemetry sample from an aircraft in transit.

The base type for the form can be found at *transport:air:telem*.

Properties:

name	type	doc
:flight	*transport:air:flight*	The flight being measured.
:latlong	*geo:latlong*	The lat/lon of the aircraft at the time.
:loc	*loc*	The location of the aircraft at the time.
:place	*geo:place*	The place that the lat/lon geocodes to.
:accuracy	*geo:dist*	The horizontal accuracy of the latlong sample.
:course	*transport:direction*	The direction, in degrees from true North, that the aircraft is traveling.
:heading	*transport:direction*	The direction, in degrees from true North, that the nose of the aircraft is pointed.
:speed	*velocity*	The ground speed of the aircraft at the time.
:airspeed	*velocity*	The air speed of the aircraft at the time.
:verticalspeed	*velocity* relative: True	The relative vertical speed of the aircraft at the time.
:altitude	*geo:altitude*	The altitude of the aircraft at the time.
:altitude:accuracy	*geo:dist*	The vertical accuracy of the altitude measurement.
:time	*time*	The time the telemetry sample was taken.

Source Edges:

source	verb	target	doc

sci:evidence	-(has)>	*	The evidence includes observations from the target nodes.
sci:experiment	-(uses)>	*	The experiment used the target nodes when it was run.
sci:observation	-(has)>	*	The observations are summarized from the target nodes.

12.2.2 Universal Properties

Universal props are system level properties which may be present on every node.

These properties are not specific to a particular form and exist outside of a particular namespace.

.created

The time the node was created in the cortex. It has the following property options set:

- Read Only: `True`

The universal property type is *time*. Its type has the following options set:

- ismin: `True`

.seen

The time interval for first/last observation of the node.

The universal property type is *ival*.

12.3 Datamodel Deprecation Policy

As the Synapse Data Model has grown and evolved over time, Vertex has found the need to deprecate model elements which are no longer useful. These elements may represent relationships which are better captured with newer elements; concepts which are better represented by convention; or other issues. As such, model elements (types, forms, and properties) which are deprecated should no longer be used for new data modeling. Deprecated model elements will be removed in a future Synapse release, no earlier than `v3.0.0`.

For deprecated model elements, suggested alternatives will be provided and example Storm queries which can be used to migrate data in such a fashion.

12.3.1 Using Deprecated Model Elements

When Deprecated model elements are used in a Cortex, the following log events will be made:

- One startup, if a extended property definition uses a deprecated type to define it, a warning message will be logged.
- If a extended property is added which uses a deprecated type to define it, a warning message will be logged.
- Any Types or Forms, from a datamodel loaded by a custom CoreModule, which use a deprecated model component will cause a warning message to be logged. This includes any Array or Comp type model elements which utilize a deprecated Type.
- If a property or tag property is set on a node which is deprecated or using a deprecated type, that will cause a warning message to be logged and a `warn` message to be sent over the Storm runtime. This only occurs once per given runtime.
- If a node is made using deprecated form or using a deprecated type, that will cause a warning message to be logged and a `warn` message to be sent over the Storm runtime. This only occurs once per given runtime.

Deleting nodes which use deprecated model elements does not trigger warnings, since that would normally be done after an associated data migration and would be excessive in the event of a large migration.

12.3.2 Deprecated Model Elements

The following elements are deprecated.

Types

- ***file:string***
  - -(refs)> it:dev:str
- ***it:reveng:funcstr***
  - Please use the *:strings* array property on the *it:reveng:function* form.
- ***lang:idiom***

  - Please use *lang:translation* instead.
- ***lang:trans***
  - Please use *lang:translation* instead.
- ***ou:hasalias***
  - *ou:hasalias* is deprecated in favor of the *:alias* property on *ou:org* nodes.
- ***ou:meet:attendee***
  - *ou:meet:attendee* has been superseded by *ou:attendee*. *ou:attendee* has the *:meet* property to denote what meeting the attendee attended.
- ***ou:conference:attendee***
  - *ou:conference:attendee* has been superseded by *ou:attendee*. *ou:attendee* has the *:conference* property to denote what conference the attendee attended.
- ***ou:conference:event:attendee***
  - *ou:conference:attendee* has been superseded by *ou:attendee*. *ou:attendee* has the *:conference* property to denote what conference event the attendee attended.
- ***ou:member***
  - *ou:member* has been superseded by *ou:position*.
- ***ps:persona***
  - Please use the *ps:person* or *ps:contact* types.
- ***ps:person:has***
  - Please use *edge:has* or a light edge.
- ***ps:persona:has***
  - Please use *ps:person* or *ps:context* in combination with an *edge:has* or a light edge.
- ***inet:ssl:cert***
  - *inet:ssl:cert* is deprecated in favor of *inet:tls:servercert* and *inet:tls:clientcert*.

Forms

Consistent with the deprecated types, the following forms are deprecated: - *file:string* - *it:reveng:funcstr* - *lang:idiom* - *lang:trans* - *ou:hasalias* - *ou:meet:attendee* - *ou:conference:attendee* - *ou:conference:event:attendee* - *ou:member* - *ps:person:has* - *ps:persona* - *ps:persona:has* - *inet:ssl:cert*

Properties

- ***ps:person***
  - ***:img***
    - *ps:person:img* has been renamed to *ps:person:photo*.
- ***it:prod:soft***
  - ***author:org*, *author:acct*, *author:email*, and *author:person***
    - These properties have been collected into the *it:prod:soft:author* property, which is typed as a *ps:contact*.

- ***media:news***
  - ***:author***
    - The *media:news:author* property has been superseded by the array property of *media:news:authors*, which is an array of type *ps:contact*.
- ***file:subfile***
  - ***:name***
    - The *file:subfile:name* property has been superseded by the property *file:subfile:path*, which is typed as *file:path*.
- ***ou:org***
  - ***:naics* and *:sic***
    - The *ou:org:naics* and *ou:org:sic* properties has been collected into the *ou:org:industries* property, which is an array of type *ou:industry*.
  - ***:has***
    - Please use an *edge:has* node or a light edge.
- ***risk:attack***
  - ***:actor:org***
    - Please use the *:attacker ps:contact* property to allow entity resolution.
  - ***:actor:person***
    - Please use the *:attacker ps:contact* property to allow entity resolution.
  - ***:target:org***
    - Please use the *:target ps:contact* property to allow entity resolution.
  - ***:target:person***
    - Please use the *:target ps:contact* property to allow entity resolution.
- ***ou:campaign***
  - ***:type***
    - Please use the *:camptype taxonomy* property.
- ***it:host***
  - ***:manu***
    - This property has been superseded by the *it:prod:hardware:make* property, which is typed as *ou:name*.
  - ***:model***
    - This property has been superseded by the *it:prod:hardware:model* property, which is typed as string.
- ***it:exec:proc***
  - ***:user***
    - Please use the *:account it:exec:proc* property to link processes to users.

CHAPTER

THIRTEEN

STORM LIBRARY DOCUMENTATION

This contains API documentation for Storm Libraries and Storm Types.

Storm Types (also called Storm Objects) are objects in the Storm Runtime that can represent values such as nodes in the runtime or objects in the Cortex. Storm Types encompass objects from strings of characters (*str*), to objects representing Cron Jobs in the Cortex (*cronjob*), to nodes in the Cortex (*node*). These objects each have their own properties and methods defined on them that can be used to inspect or edit that object. For instance, String Storm Types all have the `upper()` method defined on them that returns a new instance of that String, except with every letter turned uppercase (*upper()*). Storm Types help form the basis for programmatic manipulation of objects and data in the Cortex.

Storm Libraries are ready-made tools in the Storm query language for creating, updating, or fetching data using Storm Types. Storm libraries include functionality for making HTTP requests (via *$lib.inet.http*), scraping nodes from text (*$lib.scrape*), manipulating Cortex objects such as Queues (*$lib.queue*) and StormDmons (*$lib.dmon*), creating new Cron Jobs (*$lib.cron*), and more. Many of these libraries accept or return Storm Types as part of their usage. For instance, there is a library in Storm for interacting with OAuthv1 servers (*$lib.inet.http.oauth.v1.client(ckey, csecret, atoken, asecret, sigtype=QUERY)*), and it accepts several String Storm Types as parameters and returns an OAuthV1 client object for later usage (*inet:http:oauth:v1:client*).

Storm Libraries form a powerful bench of tools for usage within the Storm query language.

The current sections are:

13.1 Storm Libraries

Storm Libraries represent powerful tools available inside of the Storm query language.

13.1.1 $lib

The Base Storm Library. This mainly contains utility functionality.

$lib.cast(name, valu)

Normalize a value as a Synapse Data Model Type.

Args:
name (str): The name of the model type to normalize the value as.

valu (any): The value to normalize.

Returns:
The normalized value. The return type is `prim`.

$lib.copy(item)

Create and return a deep copy of the given storm object.

Note:
This is currently limited to msgpack compatible primitives.

Examples:
Make a copy of a list or dict:

```
$copy = $lib.copy($item)
```

Args:
item (prim): The item to make a copy of.

Returns:
A deep copy of the primitive object. The return type is `prim`.

$lib.debug

True if the current runtime has debugging enabled.

Note:
The debug state is inherited by sub-runtimes at instantiation time. Any changes to a runtime's debug state do not percolate automatically.

Examples:
Check if the runtime is in debug and print a message:

```
if $lib.debug {
    $lib.print('Doing stuff!")
}
```

Update the current runtime to enable debugging:

```
$lib.debug = $lib.true
```

Returns:
The return type is *boolean*. When this is used to set the value, it does not have a return type.

$lib.exit(mesg=$lib.null, **kwargs)

Cause a Storm Runtime to stop running.

Args:
mesg (str): Optional string to warn.

**kwargs (any): Keyword arguments to substitute into the mesg.

Returns:
The return type is `null`.

$lib.false

This constant represents a value of False that can be used in Storm.

Examples:
Conditionally print a statement based on the constant value:

```
cli> storm if $lib.false { $lib.print('Is True') } else { $lib.print('Is False') }
Is False
```

Returns:
The type is *boolean*.

$lib.fire(name, **info)

Fire an event onto the runtime.

Notes:
This fires events as `storm:fire` event types. The name of the event is placed into a `type` key, and any additional keyword arguments are added to a dictionary under the `data` key.

Examples:
Fire an event called `demo` with some data:

```
cli> storm $foo='bar' $lib.fire('demo', foo=$foo, knight='ni')
...
('storm:fire', {'type': 'demo', 'data': {'foo': 'bar', 'knight': 'ni'}})
...
```

Args:
name (str): The name of the event to fire.

**info (any): Additional keyword arguments containing data to add to the event.

Returns:
The return type is `null`.

$lib.guid(*args, valu=$lib.undef)

Get a random guid, or generate a guid from the arguments.

Args:

*args (prim): Arguments which are hashed to create a guid.

valu (prim): Create a guid from a single value (no positional arguments can be specified).

Returns:

A guid. The return type is *str*.

$lib.import(name, debug=$lib.false, reqvers=$lib.null)

Import a Storm module.

Args:

name (str): Name of the module to import.

debug (boolean): Enable debugging in the module.

reqvers (str): Version requirement for the imported module.

Returns:

A `lib` instance representing the imported package. The return type is `lib`.

$lib.len(item)

Get the length of a item.

This could represent the size of a string, or the number of keys in a dictionary, or the number of elements in an array. It may also be used to iterate an emitter or yield function and count the total.

Args:

item (prim): The item to get the length of.

Returns:

The length of the item. The return type is `int`.

$lib.list(*vals)

Get a Storm List object.

Args:

*vals (any): Initial values to place in the list.

Returns:

A new list object. The return type is *list*.

$lib.max(*args)

Get the maximum value in a list of arguments.

Args:
*args (any): List of arguments to evaluate.

Returns:
The largest argument. The return type is `int`.

$lib.min(*args)

Get the minimum value in a list of arguments.

Args:
*args (any): List of arguments to evaluate.

Returns:
The smallest argument. The return type is `int`.

$lib.null

This constant represents a value of None that can be used in Storm.

Examples:
Create a dictionary object with a key whose value is null, and call `$lib.fire()` with it:

```
cli> storm $d=({"key": $lib.null}) $lib.fire('demo', d=$d)
('storm:fire', {'type': 'demo', 'data': {'d': {'key': None}}})
```

Returns:
The type is `null`.

$lib.pprint(item, prefix=, clamp=$lib.null)

The pprint API should not be considered a stable interface.

Args:
item (any): Item to pprint

prefix (str): Line prefix.

clamp (int): Line clamping length.

Returns:
The return type is `null`.

$lib.print(mesg, **kwargs)

Print a message to the runtime.

Examples:

Print a simple string:

```
cli> storm $lib.print("Hello world!")
Hello world!
```

Format and print string based on variables:

```
cli> storm $d=({"key1": (1), "key2": "two"})
     for ($key, $value) in $d { $lib.print('{k} => {v}', k=$key, v=$value) }
key1 => 1
key2 => two
```

Use values off of a node to format and print string:

```
cli> storm inet:ipv4:asn
     $lib.print("node: {ndef}, asn: {asn}", ndef=$node.ndef(), asn=:asn) | spin
node: ('inet:ipv4', 16909060), asn: 1138
```

Notes:

Arbitrary objects can be printed as well. They will have their Python __repr()__ printed.

Args:

mesg (str): String to print.

**kwargs (any): Keyword arguments to substitute into the mesg.

Returns:

The return type is `null`.

$lib.raise(name, mesg, **info)

Raise an exception in the storm runtime.

Args:

name (str): The name of the error condition to raise.

mesg (str): A friendly description of the specific error.

**info (any): Additional metadata to include in the exception.

Returns:

This function does not return. The return type is `null`.

$lib.range(stop, start=$lib.null, step=$lib.null)

Generate a range of integers.

Examples:
Generate a sequence of integers based on the size of an array:

```
cli> storm $a=(foo,bar,(2)) for $i in $lib.range($lib.len($a)) {$lib.fire('test',␣
↪indx=$i, valu=$a.$i)}
Executing query at 2021/03/22 19:25:48.835
('storm:fire', {'type': 'test', 'data': {'index': 0, 'valu': 'foo'}})
('storm:fire', {'type': 'test', 'data': {'index': 1, 'valu': 'bar'}})
('storm:fire', {'type': 'test', 'data': {'index': 2, 'valu': 2}})
```

Notes:
The range behavior is the same as the Python3 `range()` builtin Sequence type.

Args:
stop (int): The value to stop at.

start (int): The value to start at.

step (int): The range step size.

Yields:
The sequence of integers. The return type is `int`.

$lib.set(*vals)

Get a Storm Set object.

Args:
*vals (any): Initial values to place in the set.

Returns:
The new set. The return type is *set*.

$lib.sorted(valu, reverse=$lib.false)

Yield sorted values.

Args:
valu (any): An iterable object to sort.

reverse (boolean): Reverse the sort order.

Yields:
Yields the sorted output. The return type is `any`.

$lib.text(*args)

Get a Storm Text object.

Args:
*args (str): An initial set of values to place in the Text. These values are joined together with an empty string.

Returns:
The new Text object. The return type is *text*.

$lib.true

This constant represents a value of True that can be used in Storm.

Examples:
Conditionally print a statement based on the constant value:

```
cli> storm if $lib.true { $lib.print('Is True') } else { $lib.print('Is False') }
Is True
```

Returns:
The type is *boolean*.

$lib.trycast(name, valu)

Attempt to normalize a value and return status and the normalized value.

Examples:
Do something if the value is a valid IPV4:

```
($ok, $ipv4) = $lib.trycast(inet:ipv4, 1.2.3.4)
if $ok { $dostuff($ipv4) }
```

Args:
name (str): The name of the model type to normalize the value as.

valu (any): The value to normalize.

Returns:
A list of (<bool>, <prim>) for status and normalized value. The return type is *list*.

$lib.undef

This constant can be used to unset variables and derefs.

Examples:
Unset the variable $foo:

```
$foo = $lib.undef
```

Remove a dictionary key bar:

```
$foo.bar = $lib.undef
```

Remove a list index of 0:

```
$foo.0 = $lib.undef
```

Returns:
The type is `undef`.

$lib.warn(mesg, **kwargs)

Print a warning message to the runtime.

Notes:
Arbitrary objects can be warned as well. They will have their Python __repr()__ printed.

Args:
mesg (str): String to warn.

**kwargs (any): Keyword arguments to substitute into the mesg.

Returns:
The return type is `null`.

13.1.2 $lib.aha

A Storm Library for interacting with AHA.

$lib.aha.del(svcname)

Delete a service from AHA.

Examples:
Deleting a service with its relative name:

```
$lib.aha.del(00.mysvc...)
```

Deleting a service with its full name:

```
$lib.aha.del(00.mysvc.loop.vertex.link)
```

Args:
svcname (str): The name of the service to delete. It is easiest to use the relative name of a service, ending with "...".

Returns:
The return type is `null`.

$lib.aha.get(svcname, filters=$lib.null)

Get information about an AHA service.

Examples:
Getting service information with a relative name:

```
$lib.aha.get(00.cortex...)
```

Getting service information with its full name:

```
$lib.aha.get(00.cortex.loop.vertex.link)
```

Args:
svcname (str): The name of the AHA service to look up. It is easiest to use the relative name of a service, ending with "…".

filters (dict): An optional dictionary of filters to use when resolving the AHA service.

Returns:
The AHA service information dictionary, or $lib.null. The return type may be one of the following: `null`, *dict*.

$lib.aha.list()

Enumerate all of the AHA services.

Yields:
The AHA service dictionaries. The return type is *list*.

13.1.3 $lib.aha.pool

A Storm Library for interacting with AHA service pools.

$lib.aha.pool.add(name)

Add a new AHA service pool.

Examples:
Add a pool via its relative name:

```
$lib.aha.pool.add(pool00.cortex...)
```

Args:
name (str): The name of the pool to add. It is easiest to use the relative name of a pool, ending with "…".

Returns:
The return type is *aha:pool*.

$lib.aha.pool.del(name)

Delete an existing AHA service pool.

Examples:
Delete a pool via its relative name:

```
$lib.aha.pool.del(pool00.cortex...)
```

Args:
name (str): The name of the pool to delete. It is easiest to use the relative name of a pool, ending with "…".

Returns:
The AHA pool definition that was deleted. The return type is *dict*.

$lib.aha.pool.get(name)

Get an existing AHA service pool.

Args:
name (str): The name of the pool to get. It is easiest to use the relative name of a pool, ending with "…".

Returns:
The pool if it exists, or $lib.null. The return type may be one of the following: `null`, *aha:pool*.

$lib.aha.pool.list()

Enumerate all of the AHA service pools.

Yields:
The return type is *aha:pool*.

13.1.4 $lib.auth

A Storm Library for interacting with Auth in the Cortex.

$lib.auth.getPermDef(perm)

Return a single permission definition.

Args:
perm (list): A permission tuple.

Returns:
A permission definition or null. The return type is *dict*.

$lib.auth.getPermDefs()

Return a list of permission definitions.

Returns:
The list of permission definitions. The return type is *list*.

$lib.auth.ruleFromText(text)

Get a rule tuple from a text string.

Args:
text (str): The string to process.

Returns:
A tuple containing a bool and a list of permission parts. The return type is *list*.

$lib.auth.textFromRule(rule)

Return a text string from a rule tuple.

Args:
rule (list): A rule tuple.

Returns:
The rule text. The return type is *str*.

13.1.5 $lib.auth.easyperm

A Storm Library for interacting with easy perm dictionaries.

$lib.auth.easyperm.allowed(edef, level)

Check if the current user has a permission level in an easy perm dictionary.

Args:
edef (dict): The easy perm dictionary to check.

level (str): The required permission level number.

Returns:
True if the user meets the requirement, false otherwise. The return type is *boolean*.

$lib.auth.easyperm.confirm(edef, level, mesg=$lib.null)

Require that the current user has a permission level in an easy perm dictionary.

Args:
edef (dict): The easy perm dictionary to check.

level (str): The required permission level number.

mesg (str): Optional error message to present if user does not have required permission level.

Returns:
The return type is `null`.

$lib.auth.easyperm.init(edef=$lib.null, default=(1))

Add the easy perm structure to a new or existing dictionary.

Note:
The current user will be given admin permission in the new easy perm structure.

Args:
edef (dict): A dictionary to add easy perms to.

default (int): Specify the default permission level for this item.

Returns:
Dictionary with the easy perm structure. The return type is *dict*.

$lib.auth.easyperm.set(edef, scope, iden, level)

Set the permission level for a user or role in an easy perm dictionary.

Args:
edef (dict): The easy perm dictionary to modify.

scope (str): The scope, either "users" or "roles".

iden (str): The user/role iden depending on scope.

level (int): The permission level number, or None to remove the permission.

Returns:
Dictionary with the updated easy perm structure. The return type is *dict*.

13.1.6 $lib.auth.gates

A Storm Library for interacting with Auth Gates in the Cortex.

$lib.auth.gates.get(iden)

Get a specific Gate by iden.

Args:
iden (str): The iden of the gate to retrieve.

Returns:
The `auth:gate` if it exists, otherwise null. The return type may be one of the following: `null`, *auth:gate*.

$lib.auth.gates.list()

Get a list of Gates in the Cortex.

Returns:
A list of `auth:gate` objects. The return type is *list*.

13.1.7 $lib.auth.roles

A Storm Library for interacting with Auth Roles in the Cortex.

$lib.auth.roles.add(name)

Add a Role to the Cortex.

Args:
name (str): The name of the role.

Returns:
The new role object. The return type is *auth:role*.

$lib.auth.roles.byname(name)

Get a specific Role by name.

Args:
name (str): The name of the role to retrieve.

Returns:
The role by name, or null if it does not exist. The return type may be one of the following: `null`, *auth:role*.

$lib.auth.roles.del(iden)

Delete a Role from the Cortex.

Args:
iden (str): The iden of the role to delete.

Returns:
The return type is `null`.

$lib.auth.roles.get(iden)

Get a specific Role by iden.

Args:
iden (str): The iden of the role to retrieve.

Returns:
The `auth:role` object; or null if the role does not exist. The return type may be one of the following: `null`, *auth:role*.

$lib.auth.roles.list()

Get a list of Roles in the Cortex.

Returns:
A list of `auth:role` objects. The return type is *list*.

13.1.8 $lib.auth.users

A Storm Library for interacting with Auth Users in the Cortex.

$lib.auth.users.add(name, passwd=$lib.null, email=$lib.null, iden=$lib.null)

Add a User to the Cortex.

Args:
name (str): The name of the user.

passwd (str): The user's password.

email (str): The user's email address.

iden (str): The iden to use to create the user.

Returns:
The `auth:user` object for the new user. The return type is *auth:user*.

$lib.auth.users.byname(name)

Get a specific user by name.

Args:
name (str): The name of the user to retrieve.

Returns:
The `auth:user` object, or none if the user does not exist. The return type may be one of the following: `null`, *auth:user*.

$lib.auth.users.del(iden)

Delete a User from the Cortex.

Args:
iden (str): The iden of the user to delete.

Returns:
The return type is `null`.

$lib.auth.users.get(iden)

Get a specific User by iden.

Args:
iden (str): The iden of the user to retrieve.

Returns:
The `auth:user` object, or none if the user does not exist. The return type may be one of the following: `null`, *auth:user*.

$lib.auth.users.list()

Get a list of Users in the Cortex.

Returns:
A list of `auth:user` objects. The return type is *list*.

13.1.9 $lib.axon

A Storm library for interacting with the Cortex's Axon.

For APIs that accept an ssl_opts argument, the dictionary may contain the following values:

```
{
    'verify': <bool> - Perform SSL/TLS verification. Is overridden by the ssl argument.
    'client_cert': <str> - PEM encoded full chain certificate for use in mTLS.
    'client_key': <str> - PEM encoded key for use in mTLS. Alternatively, can be␣
↪included in client_cert.
}
```

$lib.axon.csvrows(sha256, dialect=excel, errors=ignore, **fmtparams)

Yields CSV rows from a CSV file stored in the Axon.

Notes:
The dialect and fmtparams expose the Python csv.reader() parameters.

Example:
Get the rows from a given csv file:

```
for $row in $lib.axon.csvrows($sha256) {
    $dostuff($row)
}
```

Get the rows from a given tab separated file:

```
for $row in $lib.axon.csvrows($sha256, delimiter="\t") {
    $dostuff($row)
}
```

Args:
sha256 (str): The SHA256 hash of the file.

dialect (str): The default CSV dialect to use.

errors (str): Specify how encoding errors should handled.

**fmtparams (any): Format arguments.

Yields:
A list of strings from the CSV file. The return type is *list*.

$lib.axon.del(sha256)

Remove the bytes from the Cortex's Axon by sha256.

Example:
Delete files from the axon based on a tag:

```
file:bytes#foo +:sha256 $lib.axon.del(:sha256)
```

Args:
sha256 (hash:sha256): The sha256 of the bytes to remove from the Axon.

Returns:
True if the bytes were found and removed. The return type is *boolean*.

$lib.axon.dels(sha256s)

Remove multiple byte blobs from the Cortex's Axon by a list of sha256 hashes.

Example:
Delete a list of files (by hash) from the Axon:

```
$list = ($hash0, $hash1, $hash2)
$lib.axon.dels($list)
```

Args:
sha256s (list): A list of sha256 hashes to remove from the Axon.

Returns:
A list of boolean values that are True if the bytes were found. The return type is *list*.

$lib.axon.has(sha256)

Check if the Axon the Cortex is configured to use has a given sha256 value.

Examples:
Check if the Axon has a given file:

```
# This example assumes the Axon does have the bytes
cli> storm if $lib.axon.
↪has(9f86d081884c7d659a2feaa0c55ad015a3bf4f1b2b0b822cd15d6c15b0f00a08) {
        $lib.print("Has bytes")
    } else {
        $lib.print("Does not have bytes")
    }

Has bytes
```

Args:
sha256 (str): The sha256 value to check.

Returns:
True if the Axon has the file, false if it does not. The return type is *boolean*.

$lib.axon.hashset(sha256)

Return additional hashes of the bytes stored in the Axon for the given sha256.

Examples:
Get the md5 hash for a file given a variable named `$sha256`:

```
$hashset = $lib.axon.hashset($sha256)
$md5 = $hashset.md5
```

Args:
sha256 (str): The sha256 value to calculate hashes for.

Returns:
A dictionary of additional hashes. The return type is *dict*.

$lib.axon.jsonlines(sha256, errors=ignore)

Yields JSON objects from a JSON-lines file stored in the Axon.

Example:
Get the JSON objects from a given JSONL file:

```
for $item in $lib.axon.jsonlines($sha256) {
    $dostuff($item)
}
```

Args:
sha256 (str): The SHA256 hash of the file.

errors (str): Specify how encoding errors should handled.

Yields:
A JSON object parsed from a line of text. The return type is any.

$lib.axon.list(offs=(0), wait=$lib.false, timeout=$lib.null)

List (offset, sha256, size) tuples for files in the Axon in added order.

Example:
List files:

```
for ($offs, $sha256, $size) in $lib.axon.list() {
    $lib.print($sha256)
}
```

Start list from offset 10:

```
for ($offs, $sha256, $size) in $lib.axon.list(10) {
    $lib.print($sha256)
}
```

Args:
offs (int): The offset to start from.

wait (boolean): Wait for new results and yield them in realtime.

timeout (int): The maximum time to wait for a new result before returning.

Yields:
Tuple of (offset, sha256, size) in added order. The return type is *list*.

$lib.axon.metrics()

Get runtime metrics of the Axon.

Example:
Print the total number of files stored in the Axon:

```
$data = $lib.axon.metrics()
$lib.print("The Axon has {n} files", n=$data."file:count")
```

Returns:
A dictionary containing runtime data about the Axon. The return type is *dict*.

$lib.axon.put(byts)

Save the given bytes variable to the Axon the Cortex is configured to use.

Examples:
Save a base64 encoded buffer to the Axon:

```
cli> storm $s='dGVzdA==' $buf=$lib.base64.decode($s) ($size, $sha256)=$lib.axon.put(
↪$buf)
     $lib.print('size={size} sha256={sha256}', size=$size, sha256=$sha256)

size=4 sha256=9f86d081884c7d659a2feaa0c55ad015a3bf4f1b2b0b822cd15d6c15b0f00a08
```

Args:
byts (bytes): The bytes to save.

Returns:
A tuple of the file size and sha256 value. The return type is *list*.

$lib.axon.readlines(sha256, errors=ignore)

Yields lines of text from a plain-text file stored in the Axon.

Examples:

// Get the lines for a given file. for $line in $lib.axon.readlines($sha256) {

$dostuff($line)

}

Args:
sha256 (str): The SHA256 hash of the file.

errors (str): Specify how encoding errors should handled.

Yields:
A line of text from the file. The return type is *str*.

$lib.axon.size(sha256)

Return the size of the bytes stored in the Axon for the given sha256.

Examples:
Get the size for a file given a variable named `$sha256`:

```
$size = $lib.axon.size($sha256)
```

Args:
sha256 (str): The sha256 value to check.

Returns:
The size of the file or `null` if the file is not found. The return type may be one of the following: `int`, `null`.

$lib.axon.upload(genr)

Upload a stream of bytes to the Axon as a file.

Examples:
Upload bytes from a generator:

```
($size, $sha256) = $lib.axon.upload($getBytesChunks())
```

Args:
genr (generator): A generator which yields bytes.

Returns:
A tuple of the file size and sha256 value. The return type is *list*.

$lib.axon.urlfile(*args, **kwargs)

Retrieve the target URL using the wget() function and construct an inet:urlfile node from the response.

Notes:
This accepts the same arguments as `$lib.axon.wget()`.

Args:
*args (any): Args from `$lib.axon.wget()`.

**kwargs (any): Args from `$lib.axon.wget()`.

Returns:
The `inet:urlfile` node on success, `null` on error. The return type may be one of the following: *node*, `null`.

$lib.axon.wget(url, headers=$lib.null, params=$lib.null, method=GET, json=$lib.null, body=$lib.null, ssl=$lib.true, timeout=$lib.null, proxy=$lib.null, ssl_opts=$lib.null)

A method to download an HTTP(S) resource into the Cortex's Axon.

Notes:
The response body will be stored regardless of the status code. See the `Axon.wget()` API documentation to see the complete structure of the response dictionary.

Example:
Get the Vertex Project website:

```
$headers = ({})
$headers."User-Agent" = Foo/Bar

$resp = $lib.axon.wget("http://vertex.link", method=GET, headers=$headers)
if $resp.ok { $lib.print("Downloaded: {size} bytes", size=$resp.size) }
```

Args:
url (str): The URL to download

headers (dict): An optional dictionary of HTTP headers to send.

params (dict): An optional dictionary of URL parameters to add.

method (str): The HTTP method to use.

json (dict): A JSON object to send as the body.

body (bytes): Bytes to send as the body.

ssl (boolean): Set to False to disable SSL/TLS certificate verification.

timeout (int): Timeout for the download operation.

proxy: Set to a proxy URL string or $lib.false to disable proxy use. The input type may be one of the following: `bool`, `null`, `str`.

ssl_opts (dict): Optional SSL/TLS options. See $lib.axon help for additional details.

Returns:
A status dictionary of metadata. The return type is *dict*.

$lib.axon.wput(sha256, url, headers=$lib.null, params=$lib.null, method=PUT, ssl=$lib.true, timeout=$lib.null, proxy=$lib.null, ssl_opts=$lib.null)

A method to upload a blob from the axon to an HTTP(S) endpoint.

Args:
sha256 (str): The sha256 of the file blob to upload.

url (str): The URL to upload the file to.

headers (dict): An optional dictionary of HTTP headers to send.

params (dict): An optional dictionary of URL parameters to add.

method (str): The HTTP method to use.

ssl (boolean): Set to False to disable SSL/TLS certificate verification.

timeout (int): Timeout for the download operation.

proxy: Set to a proxy URL string or $lib.false to disable proxy use. The input type may be one of the following: `bool`, `null`, `str`.

ssl_opts (dict): Optional SSL/TLS options. See $lib.axon help for additional details.

Returns:
A status dictionary of metadata. The return type is *dict*.

13.1.10 $lib.backup

A Storm Library for interacting with the backup APIs in the Cortex.

$lib.backup.del(name)

Remove a backup by name.

Args:
name (str): The name of the backup to remove.

Returns:
The return type is `null`.

$lib.backup.list()

Get a list of backup names.

Returns:

A list of backup names. The return type is *list*.

$lib.backup.run(name=$lib.null, wait=$lib.true)

Run a Cortex backup.

Args:

name (str): The name of the backup to generate.

wait (boolean): If true, wait for the backup to complete before returning.

Returns:

The name of the newly created backup. The return type is *str*.

13.1.11 $lib.base64

A Storm Library for encoding and decoding base64 data.

$lib.base64.decode(valu, urlsafe=$lib.true)

Decode a base64 string into a bytes object.

Args:

valu (str): The string to decode.

urlsafe (boolean): Perform the decoding in a urlsafe manner if true.

Returns:

A bytes object for the decoded data. The return type is *bytes*.

$lib.base64.encode(valu, urlsafe=$lib.true)

Encode a bytes object to a base64 encoded string.

Args:

valu (bytes): The object to encode.

urlsafe (boolean): Perform the encoding in a urlsafe manner if true.

Returns:

A base64 encoded string. The return type is *str*.

13.1.12 $lib.basex

A Storm library which implements helpers for encoding and decoding strings using an arbitrary charset.

$lib.basex.decode(text, charset)

Decode a baseX string into bytes.

Args:

text (str): The hex string to be decoded into bytes.

charset (str): The charset used to decode the string.

Returns:

The decoded bytes. The return type is *bytes*.

$lib.basex.encode(byts, charset)

Encode bytes into a baseX string.

Args:

byts (bytes): The bytes to be encoded into a string.

charset (str): The charset used to encode the bytes.

Returns:

The encoded string. The return type is *str*.

13.1.13 $lib.bytes

A Storm Library for interacting with bytes storage. This Library is deprecated; use `$lib.axon.*` instead.

$lib.bytes.has(sha256)

Check if the Axon the Cortex is configured to use has a given sha256 value.

Examples:

Check if the Axon has a given file:

```
# This example assumes the Axon does have the bytes
cli> storm if $lib.bytes.
↪has(9f86d081884c7d659a2feaa0c55ad015a3bf4f1b2b0b822cd15d6c15b0f00a08) {
        $lib.print("Has bytes")
    } else {
        $lib.print("Does not have bytes")
    }

Has bytes
```

Args:

sha256 (str): The sha256 value to check.

Returns:

True if the Axon has the file, false if it does not. The return type is *boolean*.

$lib.bytes.hashset(sha256)

Return additional hashes of the bytes stored in the Axon for the given sha256.

Examples:
Get the md5 hash for a file given a variable named `$sha256`:

```
$hashset = $lib.bytes.hashset($sha256)
$md5 = $hashset.md5
```

Args:
sha256 (str): The sha256 value to calculate hashes for.

Returns:
A dictionary of additional hashes. The return type is *dict*.

$lib.bytes.put(byts)

Save the given bytes variable to the Axon the Cortex is configured to use.

Examples:
Save a base64 encoded buffer to the Axon:

```
cli> storm $s='dGVzdA==' $buf=$lib.base64.decode($s) ($size, $sha256)=$lib.bytes.
↪put($buf)
     $lib.print('size={size} sha256={sha256}', size=$size, sha256=$sha256)

size=4 sha256=9f86d081884c7d659a2feaa0c55ad015a3bf4f1b2b0b822cd15d6c15b0f00a08
```

Args:
byts (bytes): The bytes to save.

Returns:
A tuple of the file size and sha256 value. The return type is *list*.

$lib.bytes.size(sha256)

Return the size of the bytes stored in the Axon for the given sha256.

Examples:
Get the size for a file given a variable named `$sha256`:

```
$size = $lib.bytes.size($sha256)
```

Args:
sha256 (str): The sha256 value to check.

Returns:
The size of the file or `null` if the file is not found. The return type may be one of the following: `int`, `null`.

$lib.bytes.upload(genr)

Upload a stream of bytes to the Axon as a file.

Examples:
Upload bytes from a generator:

```
($size, $sha256) = $lib.bytes.upload($getBytesChunks())
```

Args:
genr (generator): A generator which yields bytes.

Returns:
A tuple of the file size and sha256 value. The return type is *list*.

13.1.14 $lib.cache

A Storm Library for interacting with Cache Objects.

$lib.cache.fixed(callback, size=(10000))

Get a new Fixed Cache object.

On a cache-miss when calling .get(), the callback Storm query is executed in a sub-runtime in the current execution context. A special variable, $cache_key, will be set to the key argument provided to .get().

The callback Storm query must contain a return statement, and if it does not return a value when executed with the input, $lib.null will be set as the value.

The fixed cache uses FIFO to evict items once the maximum size is reached.

Examples:

// Use a callback query with a function that modifies the outer runtime, // since it will run in the scope where it was defined. $test = foo

function callback(key) {
$test = $key // this will modify $test in the outer runtime return(*{$key}-val*)

}

$cache = $lib.cache.fixed(${ return($callback($cache_key)) }) $value = $cache.get(bar) $lib.print($test) // this will equal "bar"

// Use a callback query that will not modify the outer runtime, // except for variables accessible as references. $test = foo $tests = ([])

$cache = $lib.cache.fixed(${
$test = $cache_key // this will *not* modify $test in the outer runtime $tests.append($cache_key) // this will modify $tests in the outer runtime return(*{$cache_key}-val*)

})

$value = $cache.get(bar) $lib.print($test) // this will equal "foo" $lib.print($tests) // this will equal (foo,)

Args:
callback: A Storm query that will return a value for $cache_key on a cache miss. The input type may be one of the following: `str`, `storm:query`.

size (int): The maximum size of the cache.

Returns:
A new `cache:fixed` object. The return type is *cache:fixed*.

13.1.15 $lib.cell

A Storm Library for interacting with the Cortex.

$lib.cell.getBackupInfo()

Get information about recent backup activity.

Returns:
A dictionary containing backup information. The return type is *dict*.

$lib.cell.getCellInfo()

Return metadata specific for the Cortex.

Returns:
A dictionary containing metadata. The return type is *dict*.

$lib.cell.getHealthCheck()

Get healthcheck information about the Cortex.

Returns:
A dictionary containing healthcheck information. The return type is *dict*.

$lib.cell.getMirrorUrls(name=$lib.null)

Get mirror Telepath URLs for an AHA configured service.

Args:
name (str): The name, or iden, of the service to get mirror URLs for (defaults to the Cortex if not provided).

Returns:
A list of Telepath URLs. The return type is *list*.

$lib.cell.getSystemInfo()

Get info about the system in which the Cortex is running.

Returns:
A dictionary containing system information. The return type is *dict*.

$lib.cell.hotFixesApply()

Apply known data migrations and fixes via storm.

Returns:
Tuple containing the current version after applying the fixes. The return type is *list*.

$lib.cell.hotFixesCheck()

Check to see if there are known hot fixes to apply.

Returns:
Bool indicating if there are hot fixes to apply or not. The return type is *boolean*.

$lib.cell.trimNexsLog(consumers=$lib.null, timeout=(30))

Rotate and cull the Nexus log (and any consumers) at the current offset.

If the consumers argument is provided they will first be checked if online before rotating and raise otherwise. After rotation, all consumers provided must catch-up to the offset to cull at within the specified timeout before executing the cull, and will raise otherwise.

Args:
consumers (array): List of Telepath URLs for consumers of the Nexus log.

timeout (int): Time (in seconds) to wait for consumers to catch-up before culling.

Returns:
The offset that was culled (up to and including). The return type is `int`.

$lib.cell.uptime(name=$lib.null)

Get update data for the Cortex or a connected Service.

Args:
name (str): The name, or iden, of the service to get uptime data for (defaults to the Cortex if not provided).

Returns:
A dictionary containing uptime data. The return type is *dict*.

13.1.16 $lib.compression.bzip2

A Storm library which implements helpers for bzip2 compression.

$lib.compression.bzip2.en(valu)

Compress bytes using bzip2 and return them.

Example:
Compress bytes with bzip2:

```
$foo = $lib.compression.bzip2.en($mybytez)
```

Args:
valu (bytes): The bytes to be compressed.

Returns:
The bzip2 compressed bytes. The return type is *bytes*.

$lib.compression.bzip2.un(valu)

Decompress bytes using bzip2 and return them.

Example:
Decompress bytes with bzip2:

```
$foo = $lib.compression.bzip2.un($mybytez)
```

Args:
valu (bytes): The bytes to be decompressed.

Returns:
Decompressed bytes. The return type is *bytes*.

13.1.17 $lib.compression.gzip

A Storm library which implements helpers for gzip compression.

$lib.compression.gzip.en(valu)

Compress bytes using gzip and return them.

Example:
Compress bytes with gzip:

```
$foo = $lib.compression.gzip.en($mybytez)
```

Args:
valu (bytes): The bytes to be compressed.

Returns:
The gzip compressed bytes. The return type is *bytes*.

$lib.compression.gzip.un(valu)

Decompress bytes using gzip and return them.

Example:
Decompress bytes with gzip:

```
$foo = $lib.compression.gzip.un($mybytez)
```

Args:
valu (bytes): The bytes to be decompressed.

Returns:
Decompressed bytes. The return type is *bytes*.

13.1.18 $lib.compression.zlib

A Storm library which implements helpers for zlib compression.

$lib.compression.zlib.en(valu)

Compress bytes using zlib and return them.

Example:
Compress bytes with zlib:

```
$foo = $lib.compression.zlib.en($mybytez)
```

Args:
valu (bytes): The bytes to be compressed.

Returns:
The zlib compressed bytes. The return type is *bytes*.

$lib.compression.zlib.un(valu)

Decompress bytes using zlib and return them.

Example:
Decompress bytes with zlib:

```
$foo = $lib.compression.zlib.un($mybytez)
```

Args:
valu (bytes): The bytes to be decompressed.

Returns:
Decompressed bytes. The return type is *bytes*.

13.1.19 $lib.cortex.httpapi

Library for interacting with the Extended HTTP API.

$lib.cortex.httpapi.add(path, name=, desc=, runas=owner, authenticated=$lib.true, readonly=$lib.false)

Add an Extended HTTP API endpoint to the Cortex.

This can be used to add an API endpoint which will be resolved under the API path "/api/ext/". New API endpoint objects are appended to a list of APIs to resolve in order.

Notes:
The Cortex does not make any attempt to do any inspection of path values which may conflict between one another. This is because the paths for a given endpoint may be changed, they can contain regular expressions, and they may have their resolution order changed. Cortex administrators are responsible for configuring their Extended HTTP API endpoints with correct paths and order to meet their use cases.

Example:
Add a simple API handler:

```
// Create an endpoint for /api/ext/foo/bar
$api = $lib.cortex.httpapi.add('foo/bar')

// Define a GET response handler via storm that makes a simple reply.
$api.methods.get = ${ $request.reply(200, body=({"some": "data}) }
```

Add a wildcard handler:

```
// Create a wildcard endpoint for /api/ext/some/thing([a-zA-Z0-9]*)/([a-zA-Z0-9]*)
$api = $lib.cortex.httpapi.add('some/thing([a-zA-Z0-9]*)/([a-zA-Z0-9]*)')

// The capture groups are exposed as request arguments.
// Echo them back to the caller.
$api.methods.get = ${
    $request.reply(200, body=({"args": $request.args})
}
```

Args:

path (string): The extended HTTP API path.

name (string): Friendly name for the Extended HTTP API

desc (string): Description for the Extended HTTP API.

runas (string): Run the storm query as the API “owner” or as the authenticated “user”.

authenticated (boolean): Require the API endpoint to be authenticated.

readonly (boolean): Run the Extended HTTP Storm methods in readonly mode.

Returns:

A new `http:api` object. The return type is *http:api*.

$lib.cortex.httpapi.del(iden)

Delete an Extended HTTP API endpoint.

Args:

iden (string): The iden of the API to delete.

Returns:

The return type is `null`.

$lib.cortex.httpapi.get(iden)

Get an Extended `http:api` object.

Args:

iden (string): The iden of the API to retrieve.

Returns:

The `http:api` object. The return type is *http:api*.

$lib.cortex.httpapi.getByPath(path)

Get an Extended `http:api` object by path.

Notes:
The path argument is evaluated as a regular expression input, and will be used to get the first HTTP API handler whose path value has a match.

Args:
path (string): Path to use to retrieve an object.

Returns:
The `http:api` object or `$lib.null` if there is no match. The return type may be one of the following: *http:api*, `null`.

$lib.cortex.httpapi.index(iden, index=(0))

Set the index for a given Extended HTTP API.

Args:
iden (string): The iden of the API to modify.

index (int): The new index of the API. Uses zero based indexing.

Returns:
The new index location of the API. The return type is `int`.

$lib.cortex.httpapi.list()

Get all the Extended HTTP APIs on the Cortex

Returns:
A list of `http:api` objects The return type is *list*.

$lib.cortex.httpapi.response(requestinfo)

Make a response object. Used by API handlers automatically.

Args:
requestinfo (dict): Request info dictionary. This is an opaque data structure which may change.

Returns:
The return type is *http:api:request*.

13.1.20 $lib.cron

A Storm Library for interacting with Cron Jobs in the Cortex.

$lib.cron.add(**kwargs)

Add a recurring Cron Job to the Cortex.

Args:
**kwargs (any): Key-value parameters used to add the cron job.

Returns:
The new Cron Job. The return type is *cronjob*.

$lib.cron.at(**kwargs)

Add a non-recurring Cron Job to the Cortex.

Args:
**kwargs (any): Key-value parameters used to add the cron job.

Returns:
The new Cron Job. The return type is *cronjob*.

$lib.cron.del(prefix)

Delete a CronJob from the Cortex.

Args:
prefix (str): A prefix to match in order to identify a cron job to delete. Only a single matching prefix will be deleted.

Returns:
The return type is `null`.

$lib.cron.disable(prefix)

Disable a CronJob in the Cortex.

Args:
prefix (str): A prefix to match in order to identify a cron job to disable. Only a single matching prefix will be disabled.

Returns:
The iden of the CronJob which was disabled. The return type is *str*.

$lib.cron.enable(prefix)

Enable a CronJob in the Cortex.

Args:
prefix (str): A prefix to match in order to identify a cron job to enable. Only a single matching prefix will be enabled.

Returns:
The iden of the CronJob which was enabled. The return type is *str*.

$lib.cron.get(prefix)

Get a CronJob in the Cortex.

Args:
prefix (str): A prefix to match in order to identify a cron job to get. Only a single matching prefix will be retrieved.

Returns:
The requested cron job. The return type is *cronjob*.

$lib.cron.list()

List CronJobs in the Cortex.

Returns:
A list of `cronjob` objects. The return type is *list*.

$lib.cron.mod(prefix, query)

Modify the Storm query for a CronJob in the Cortex.

Args:
prefix (str): A prefix to match in order to identify a cron job to modify. Only a single matching prefix will be modified.

query: The new Storm query for the Cron Job. The input type may be one of the following: `str`, `query`.

Returns:
The iden of the CronJob which was modified. The return type is *str*.

$lib.cron.move(prefix, view)

Move a cron job to a new view.

Args:
prefix (str): A prefix to match in order to identify a cron job to move. Only a single matching prefix will be modified.

view (str): The iden of the view to move the CrobJob to

Returns:
The iden of the CronJob which was moved. The return type is *str*.

13.1.21 $lib.crypto.coin.ethereum

A Storm library which implements helpers for Ethereum.

$lib.crypto.coin.ethereum.eip55(addr)

Convert an Ethereum address to a checksummed address.

Args:
addr (str): The Ethereum address to be converted.

Returns:
A list of (<bool>, <addr>) for status and checksummed address. The return type is *list*.

13.1.22 $lib.crypto.hashes

A Storm Library for hashing bytes

$lib.crypto.hashes.md5(byts)

Retrieve an MD5 hash of a byte string.

Args:
byts (bytes): The bytes to hash.

Returns:
The hex digest of the MD5 hash of the input bytes. The return type is *str*.

$lib.crypto.hashes.sha1(byts)

Retrieve a SHA1 hash of a byte string.

Args:
byts (bytes): The bytes to hash.

Returns:
The hex digest of the SHA1 hash of the input bytes. The return type is *str*.

$lib.crypto.hashes.sha256(byts)

Retrieve a SHA256 hash of a byte string.

Args:
byts (bytes): The bytes to hash.

Returns:
The hex digest of the SHA256 hash of the input bytes. The return type is *str*.

$lib.crypto.hashes.sha512(byts)

Retrieve a SHA512 hash of a byte string.

Args:
byts (bytes): The bytes to hash.

Returns:
The hex digest of the SHA512 hash of the input bytes. The return type is *str*.

13.1.23 $lib.crypto.hmac

A Storm library for computing RFC2104 HMAC values.

$lib.crypto.hmac.digest(key, mesg, alg=sha256)

Compute the digest value of a message using RFC2104 HMAC.

Examples:

Compute the HMAC-SHA256 digest for a message with a secret key:

```
$digest = $lib.crypto.hmac.digest(key=$secretKey.encode(), mesg=$mesg.encode())
```

Args:

key (bytes): The key to use for the HMAC calculation.

mesg (bytes): The message to use for the HMAC calculation.

alg (str): The digest algorithm to use.

Returns:

The binary digest of the HMAC value. The return type is *bytes*.

13.1.24 $lib.csv

A Storm Library for interacting with csvtool.

$lib.csv.emit(*args, table=$lib.null)

Emit a `csv:row` event to the Storm runtime for the given args.

Args:

*args (any): Items which are emitted as a `csv:row` event.

table (str): The name of the table to emit data too. Optional.

Returns:

The return type is `null`.

13.1.25 $lib.dict

A Storm Library for interacting with dictionaries.

$lib.dict.keys(valu)

Retrieve a list of keys in the specified dictionary.

Args:

valu (dict): The dictionary to operate on.

Returns:

List of keys in the specified dictionary. The return type is *list*.

$lib.dict.pop(valu, key, default=$lib.undef)

Remove specified key and return the corresponding value.

Args:

valu (dict): The dictionary to operate on.

key (str): The key name of the value to pop.

default (any): Optional default value to return if the key does not exist in the dictionary.

Returns:

The popped value. The return type is `any`.

$lib.dict.update(valu, other)

Update the specified dictionary with keys/values from another dictionary.

Args:

valu (dict): The target dictionary (update to).

other (dict): The source dictionary (update from).

Returns:

The return type is `null`.

$lib.dict.values(valu)

Retrieve a list of values in the specified dictionary.

Args:

valu (dict): The dictionary to operate on.

Returns:

List of values in the specified dictionary. The return type is *list*.

13.1.26 $lib.dmon

A Storm Library for interacting with StormDmons.

$lib.dmon.add(text, name=noname, ddef=$lib.null)

Add a Storm Dmon to the Cortex.

Examples:

Add a dmon that executes a query:

```
$lib.dmon.add(${ myquery }, name='example dmon')
```

Args:

text: The Storm query to execute in the Dmon loop. The input type may be one of the following: `str`, `storm:query`.

name (str): The name of the Dmon.

ddef (dict): Additional daemon definition fields.

Returns:
The iden of the newly created Storm Dmon. The return type is *str*.

$lib.dmon.bump(iden)

Restart the Dmon.

Args:
iden (str): The GUID of the dmon to restart.

Returns:
True if the Dmon is restarted; False if the iden does not exist. The return type is *boolean*.

$lib.dmon.del(iden)

Delete a Storm Dmon by iden.

Args:
iden (str): The iden of the Storm Dmon to delete.

Returns:
The return type is `null`.

$lib.dmon.get(iden)

Get a Storm Dmon definition by iden.

Args:
iden (str): The iden of the Storm Dmon to get.

Returns:
A Storm Dmon definition dict. The return type is *dict*.

$lib.dmon.list()

Get a list of Storm Dmons.

Returns:
A list of Storm Dmon definitions. The return type is *list*.

$lib.dmon.log(iden)

Get the messages from a Storm Dmon.

Args:
iden (str): The iden of the Storm Dmon to get logs for.

Returns:
A list of messages from the StormDmon. The return type is *list*.

$lib.dmon.start(iden)

Start a storm dmon.

Args:
iden (str): The GUID of the dmon to start.

Returns:
$lib.true unless the dmon does not exist or was already started. The return type is *boolean*.

$lib.dmon.stop(iden)

Stop a Storm Dmon.

Args:
iden (str): The GUID of the Dmon to stop.

Returns:
$lib.true unless the dmon does not exist or was already stopped. The return type is *boolean*.

13.1.27 $lib.export

A Storm Library for exporting data.

$lib.export.toaxon(query, opts=$lib.null)

Run a query as an export (fully resolving relationships between nodes in the output set) and save the resulting stream of packed nodes to the axon.

Args:
query (str): A query to run as an export.

opts (dict): Storm runtime query option params.

Returns:
Returns a tuple of (size, sha256). The return type is *list*.

13.1.28 $lib.feed

A Storm Library for interacting with Cortex feed functions.

$lib.feed.genr(name, data)

Yield nodes being added to the graph by adding data with a given ingest type.

Notes:
This is using the Runtimes's Snap to call addFeedNodes(). This only yields nodes if the feed function yields nodes. If the generator is not entirely consumed there is no guarantee that all of the nodes which should be made by the feed function will be made.

Args:
name (str): Name of the ingest function to send data too.

data (prim): Data to send to the ingest function.

Yields:
Yields Nodes as they are created by the ingest function. The return type is *node*.

$lib.feed.ingest(name, data)

Add nodes to the graph with a given ingest type.

Notes:
This is using the Runtimes's Snap to call addFeedData(), after setting the snap.strict mode to False. This will cause node creation and property setting to produce warning messages, instead of causing the Storm Runtime to be torn down.

Args:
name (str): Name of the ingest function to send data too.

data (prim): Data to send to the ingest function.

Returns:
The return type is `null`.

$lib.feed.list()

Get a list of feed functions.

Returns:
A list of feed functions. The return type is *list*.

13.1.29 $lib.gen

A Storm Library for secondary property based deconfliction.

$lib.gen.campaign(name, reporter)

Returns an ou:campaign node based on the campaign and reporter names, adding the node if it does not exist.

Args:
name (str): The reported name of the campaign.

reporter (str): The name of the organization which reported the campaign.

Returns:
An ou:campaign node. The return type is *node*.

$lib.gen.geoPlaceByName(name)

Returns a geo:place node by name, adding the node if it does not exist.

Args:
name (str): The name of the place.

Returns:
A geo:place node with the given name. The return type is *node*.

$lib.gen.industryByName(name)

Returns an ou:industry by name, adding the node if it does not exist.

Args:
name (str): The name of the industry.

Returns:
An ou:industry node with the given name. The return type is *node*.

$lib.gen.itAvScanResultByTarget(form, value, signame, scanner=$lib.null, time=$lib.null, try=$lib.false)

Returns an it:av:scan:result node by deconflicting with a target and signature name, adding the node if it does not exist.

Args:
form (str): The target form.

value (str): The target value.

signame (str): The signature name.

scanner (str): An optional scanner software name to include in deconfliction.

time (time): An optional time when the scan was run to include in the deconfliction.

try (boolean): Type normalization will fail silently instead of raising an exception.

Returns:
An it:av:scan:result node. The return type is *node*.

$lib.gen.langByCode(name, try=$lib.false)

Returns a lang:language node by language code, adding the node if it does not exist.

Args:
name (str): The language code for the language.

try (boolean): Type normalization will fail silently instead of raising an exception.

Returns:
A lang:language node with the given code. The return type is *node*.

$lib.gen.langByName(name)

Returns a lang:language node by name, adding the node if it does not exist.

Args:
name (str): The name of the language.

Returns:
A lang:language node with the given name. The return type is *node*.

$lib.gen.newsByUrl(url, try=$lib.false)

Returns a media:news node by URL, adding the node if it does not exist.

Args:
url (inet:url): The URL where the news is published.

try (boolean): Type normalization will fail silently instead of raising an exception.

Returns:
A media:news node with the given URL. The return type is *node*.

$lib.gen.orgByFqdn(fqdn, try=$lib.false)

Returns an ou:org node by FQDN, adding the node if it does not exist.

Args:
fqdn (str): The FQDN of the org.

try (boolean): Type normalization will fail silently instead of raising an exception.

Returns:
An ou:org node with the given FQDN. The return type is *node*.

$lib.gen.orgByName(name)

Returns an ou:org by name, adding the node if it does not exist.

Args:
name (str): The name of the org.

Returns:
An ou:org node with the given name. The return type is *node*.

$lib.gen.orgHqByName(name)

Returns a ps:contact node for the ou:org, adding the node if it does not exist.

Args:
name (str): The name of the org.

Returns:
A ps:contact node for the ou:org with the given name. The return type is *node*.

$lib.gen.polCountryByIso2(iso2, try=$lib.false)

Returns a pol:country node by deconflicting the :iso2 property.

Args:
iso2 (str): The pol:country:iso2 property.

try (boolean): Type normalization will fail silently instead of raising an exception.

Returns:
A pol:country node. The return type is *node*.

$lib.gen.psContactByEmail(type, email, try=$lib.false)

Returns a ps:contact by deconflicting the type and email address.

Args:
type (str): The ps:contact:type property.

email (str): The ps:contact:email property.

try (boolean): Type normalization will fail silently instead of raising an exception.

Returns:
A ps:contact node. The return type is *node*.

$lib.gen.riskThreat(name, reporter)

Returns a risk:threat node based on the threat and reporter names, adding the node if it does not exist.

Args:
name (str): The reported name of the threat cluster.

reporter (str): The name of the organization which reported the threat cluster.

Returns:
A risk:threat node. The return type is *node*.

$lib.gen.riskToolSoftware(name, reporter)

Returns a risk:tool:software node based on the tool and reporter names, adding the node if it does not exist.

Args:
name (str): The reported name of the tool.

reporter (str): The name of the organization which reported the tool.

Returns:
A risk:tool:software node. The return type is *node*.

$lib.gen.softByName(name)

Returns it:prod:soft node by name, adding the node if it does not exist.

Args:
name (str): The name of the software.

Returns:
An it:prod:soft node with the given name. The return type is *node*.

$lib.gen.vulnByCve(cve, try=$lib.false, reporter=$lib.null)

Returns risk:vuln node by CVE and reporter, adding the node if it does not exist.

Args:
cve (str): The CVE id.

try (boolean): Type normalization will fail silently instead of raising an exception.

reporter (str): The name of the organization which reported the vulnerability.

Returns:
A risk:vuln node with the given CVE. The return type is *node*.

13.1.30 $lib.gis

A Storm library which implements helpers for earth based geospatial calculations.

$lib.gis.bbox(lon, lat, dist)

Calculate a min/max bounding box for the specified circle.

Args:
lon (float): The longitude in degrees.

lat (float): The latitude in degrees.

dist (int): A distance in geo:dist base units (mm).

Returns:
A tuple of (lonmin, lonmax, latmin, latmax). The return type is *list*.

13.1.31 $lib.globals

A Storm Library for interacting with global variables which are persistent across the Cortex.

$lib.globals.get(name, default=$lib.null)

Get a Cortex global variables.

Args:
name (str): Name of the variable.

default (prim): Default value to return if the variable is not set.

Returns:
The variable value. The return type is `prim`.

$lib.globals.list()

Get a list of variable names and values.

Returns:
A list of tuples with variable names and values that the user can access. The return type is *list*.

$lib.globals.pop(name, default=$lib.null)

Delete a variable value from the Cortex.

Args:
name (str): Name of the variable.

default (prim): Default value to return if the variable is not set.

Returns:
The variable value. The return type is `prim`.

$lib.globals.set(name, valu)

Set a variable value in the Cortex.

Args:
name (str): The name of the variable to set.

valu (prim): The value to set.

Returns:
The variable value. The return type is `prim`.

13.1.32 $lib.graph

A Storm Library for interacting with graph projections in the Cortex.

$lib.graph.activate(iden)

Set the graph projection to use for the top level Storm Runtime.

Args:
iden (str): The iden of the graph projection to use.

Returns:
The return type is `null`.

$lib.graph.add(gdef)

Add a graph projection to the Cortex.

Example:
Add a graph projection named "Test Projection":

```
$rules = ({
    "name": "Test Projection",
    "desc": "My test projection",
    "degrees": 2,
    "pivots": ["-> meta:seen"],
    "filters": ["-#nope"],
    "forms": {
        "inet:fqdn": {
            "pivots": ["<- *", "-> *"],
            "filters": ["-inet:fqdn:issuffix=1"]
        },
        "*": {
            "pivots": ["-> #"],
        }
    }
})
$lib.graph.add($rules)
```

Args:
gdef (dict): A graph projection definition.

Returns:
The return type is `null`.

$lib.graph.del(iden)

Delete a graph projection from the Cortex.

Args:
iden (str): The iden of the graph projection to delete.

Returns:
The return type is `null`.

$lib.graph.get(iden=$lib.null)

Get a graph projection definition from the Cortex.

Args:
iden (str): The iden of the graph projection to get. If not specified, returns the current graph projection.

Returns:
A graph projection definition, or None if no iden was specified and there is currently no graph projection set. The return type is *dict*.

$lib.graph.grant(gden, scope, iden, level)

Modify permissions granted to users/roles on a graph projection.

Args:

gden (str): Iden of the graph projection to modify.

scope (str): The scope, either "users" or "roles".

iden (str): The user/role iden depending on scope.

level (int): The permission level number.

Returns:

The return type is `null`.

$lib.graph.list()

List the graph projections available in the Cortex.

Returns:

A list of graph projection definitions. The return type is *list*.

$lib.graph.mod(iden, info)

Modify user editable properties of a graph projection.

Args:

iden (str): The iden of the graph projection to modify.

info (dict): A dictionary of the properties to edit.

Returns:

The return type is `null`.

13.1.33 $lib.hex

A Storm library which implements helpers for hexadecimal encoded strings.

$lib.hex.decode(valu)

Decode a hexadecimal string into bytes.

Args:

valu (str): The hex string to be decoded into bytes.

Returns:

The decoded bytes. The return type is *bytes*.

$lib.hex.encode(valu)

Encode bytes into a hexadecimal string.

Args:
valu (bytes): The bytes to be encoded into a hex string.

Returns:
The hex encoded string. The return type is *str*.

$lib.hex.fromint(valu, length, signed=$lib.false)

Convert an integer to a big endian hexadecimal string.

Args:
valu (int): The integer to be converted.

length (int): The number of bytes to use to represent the integer.

signed (bool): If true, convert as a signed value.

Returns:
The resulting hex string. The return type is *str*.

$lib.hex.signext(valu, length)

Sign extension pad a hexadecimal encoded signed integer.

Args:
valu (str): The hex string to pad.

length (int): The number of characters to pad the string to.

Returns:
The sign extended hex string. The return type is *str*.

$lib.hex.toint(valu, signed=$lib.false)

Convert a big endian hexadecimal string to an integer.

Args:
valu (str): The hex string to be converted.

signed (bool): If true, convert to a signed integer.

Returns:
The resulting integer. The return type is `int`.

$lib.hex.trimext(valu)

Trim sign extension bytes from a hexadecimal encoded signed integer.

Args:
valu (str): The hex string to trim.

Returns:
The trimmed hex string. The return type is *str*.

13.1.34 $lib.inet.http

A Storm Library exposing an HTTP client API.

For APIs that accept an ssl_opts argument, the dictionary may contain the following values:

```
{
    'verify': <bool> - Perform SSL/TLS verification. Is overridden by the ssl_verify␣
↪argument.
    'client_cert': <str> - PEM encoded full chain certificate for use in mTLS.
    'client_key': <str> - PEM encoded key for use in mTLS. Alternatively, can be␣
↪included in client_cert.
}
```

$lib.inet.http.codereason(code)

Get the reason phrase for an HTTP status code.

Examples:
Get the reason for a 404 status code:

```
$str=$lib.inet.http.codereason(404)
```

Args:
code (int): The HTTP status code.

Returns:
The reason phrase for the status code. The return type is *str*.

$lib.inet.http.connect(url, headers=$lib.null, ssl_verify=$lib.true, timeout=(300), params=$lib.null, proxy=$lib.null, ssl_opts=$lib.null)

Connect a web socket to tx/rx JSON messages.

Args:
url (str): The URL to retrieve.

headers (dict): HTTP headers to send with the request.

ssl_verify (boolean): Perform SSL/TLS verification.

timeout (int): Total timeout for the request in seconds.

params (dict): Optional parameters which may be passed to the connection request.

proxy: Set to a proxy URL string or $lib.false to disable proxy use. The input type may be one of the following: `bool`, `null`, `str`.

ssl_opts (dict): Optional SSL/TLS options. See $lib.inet.http help for additional details.

Returns:
A websocket object. The return type is *inet:http:socket*.

$lib.inet.http.get(url, headers=$lib.null, ssl_verify=$lib.true, params=$lib.null, timeout=(300), allow_redirects=$lib.true, proxy=$lib.null, ssl_opts=$lib.null)

Get the contents of a given URL.

Args:
url (str): The URL to retrieve.

headers (dict): HTTP headers to send with the request.

ssl_verify (boolean): Perform SSL/TLS verification.

params (dict): Optional parameters which may be passed to the request.

timeout (int): Total timeout for the request in seconds.

allow_redirects (bool): If set to false, do not follow redirects.

proxy: Set to a proxy URL string or $lib.false to disable proxy use. The input type may be one of the following: `bool`, `null`, `str`.

ssl_opts (dict): Optional SSL/TLS options. See $lib.inet.http help for additional details.

Returns:
The response object. The return type is *inet:http:resp*.

$lib.inet.http.head(url, headers=$lib.null, ssl_verify=$lib.true, params=$lib.null, timeout=(300), allow_redirects=$lib.false, proxy=$lib.null, ssl_opts=$lib.null)

Get the HEAD response for a URL.

Args:
url (str): The URL to retrieve.

headers (dict): HTTP headers to send with the request.

ssl_verify (boolean): Perform SSL/TLS verification.

params (dict): Optional parameters which may be passed to the request.

timeout (int): Total timeout for the request in seconds.

allow_redirects (bool): If set to true, follow redirects.

proxy: Set to a proxy URL string or $lib.false to disable proxy use. The input type may be one of the following: `bool`, `null`, `str`.

ssl_opts (dict): Optional SSL/TLS options. See $lib.inet.http help for additional details.

Returns:
The response object. The return type is *inet:http:resp*.

$lib.inet.http.post(url, headers=$lib.null, json=$lib.null, body=$lib.null, ssl_verify=$lib.true, params=$lib.null, timeout=(300), allow_redirects=$lib.true, fields=$lib.null, proxy=$lib.null, ssl_opts=$lib.null)

Post data to a given URL.

Args:

url (str): The URL to post to.

headers (dict): HTTP headers to send with the request.

json (prim): The data to post, as JSON object.

body (bytes): The data to post, as binary object.

ssl_verify (boolean): Perform SSL/TLS verification.

params (dict): Optional parameters which may be passed to the request.

timeout (int): Total timeout for the request in seconds.

allow_redirects (bool): If set to false, do not follow redirects.

fields (list): A list of info dictionaries containing the name, value or sha256, and additional parameters for fields to post, as multipart/form-data. If a sha256 is specified, the request will be sent from the axon and the corresponding file will be uploaded as the value for the field.

proxy: Set to a proxy URL string or $lib.false to disable proxy use. The input type may be one of the following: `bool`, `null`, `str`.

ssl_opts (dict): Optional SSL/TLS options. See $lib.inet.http help for additional details.

Returns:

The response object. The return type is *inet:http:resp*.

$lib.inet.http.request(meth, url, headers=$lib.null, json=$lib.null, body=$lib.null, ssl_verify=$lib.true, params=$lib.null, timeout=(300), allow_redirects=$lib.true, fields=$lib.null, proxy=$lib.null, ssl_opts=$lib.null)

Make an HTTP request using the given HTTP method to the url.

Args:

meth (str): The HTTP method. (ex. PUT)

url (str): The URL to send the request to.

headers (dict): HTTP headers to send with the request.

json (prim): The data to include in the body, as JSON object.

body (bytes): The data to include in the body, as binary object.

ssl_verify (boolean): Perform SSL/TLS verification.

params (dict): Optional parameters which may be passed to the request.

timeout (int): Total timeout for the request in seconds.

allow_redirects (bool): If set to false, do not follow redirects.

fields (list): A list of info dictionaries containing the name, value or sha256, and additional parameters for fields to post, as multipart/form-data. If a sha256 is specified, the request will be sent from the axon and the corresponding file will be uploaded as the value for the field.

proxy: Set to a proxy URL string or $lib.false to disable proxy use. The input type may be one of the following: `bool`, `null`, `str`.

ssl_opts (dict): Optional SSL/TLS options. See $lib.inet.http help for additional details.

Returns:
The response object. The return type is *inet:http:resp*.

$lib.inet.http.urldecode(text)

Urldecode a text string.

This will replace %xx escape characters with the special characters they represent and replace plus signs with spaces.

Examples:
Urlencode a string:

```
$str=$lib.inet.http.urldecode("http%3A%2F%2Fgo+ogle.com")
```

Args:
text (str): The text string.

Returns:
The urldecoded string. The return type is *str*.

$lib.inet.http.urlencode(text)

Urlencode a text string.

This will replace special characters in a string using the %xx escape and replace spaces with plus signs.

Examples:
Urlencode a string:

```
$str=$lib.inet.http.urlencode("http://google.com")
```

Args:
text (str): The text string.

Returns:
The urlencoded string. The return type is *str*.

13.1.35 $lib.inet.http.oauth.v1

A Storm library to handle OAuth v1 authentication.

$lib.inet.http.oauth.v1.client(ckey, csecret, atoken, asecret, sigtype=QUERY)

Initialize an OAuthV1 Client to use for signing/authentication.

Args:

ckey (str): The OAuthV1 Consumer Key to store and use for signing requests.

csecret (str): The OAuthV1 Consumer Secret used to sign requests.

atoken (str): The OAuthV1 Access Token (or resource owner key) to use to sign requests.)

asecret (str): The OAuthV1 Access Token Secret (or resource owner secret) to use to sign requests.

sigtype (str): Where to populate the signature (in the HTTP body, in the query parameters, or in the header)

Returns:

An OAuthV1 client to be used to sign requests. The return type is *inet:http:oauth:v1:client*.

13.1.36 $lib.inet.http.oauth.v2

A Storm library for managing OAuth V2 clients.

$lib.inet.http.oauth.v2.addProvider(conf)

Add a new provider configuration.

Example:

Add a new provider which uses the authorization code flow:

```
$iden = $lib.guid(example, provider, oauth)
$conf = ({
    "iden": $iden,
    "name": "example_provider",
    "client_id": "yourclientid",
    "client_secret": "yourclientsecret",
    "scope": "first_scope second_scope",
    "auth_uri": "https://provider.com/auth",
    "token_uri": "https://provider.com/token",
    "redirect_uri": "https://local.redirect.com/oauth",
})

// Optionally enable PKCE
$conf.extensions = ({"pkce": $lib.true})

// Optionally disable SSL verification
$conf.ssl_verify = $lib.false

// Optionally provide additional key-val parameters
// to include when calling the auth URI
$conf.extra_auth_params = ({"customparam": "foo"})

$lib.inet.http.oauth.v2.addProvider($conf)
```

Args:

conf (dict): A provider configuration.

Returns:
The return type is `null`.

$lib.inet.http.oauth.v2.clearUserAccessToken(iden)

Clear the stored refresh data for the current user's provider access token.

Args:
iden (str): The provider iden.

Returns:
The existing token state data or None if it did not exist. The return type is *dict*.

$lib.inet.http.oauth.v2.delProvider(iden)

Delete a provider configuration.

Args:
iden (str): The provider iden.

Returns:
The deleted provider configuration or None if it does not exist. The return type is *dict*.

$lib.inet.http.oauth.v2.getProvider(iden)

Get a provider configuration

Args:
iden (str): The provider iden.

Returns:
The provider configuration or None if it does not exist. The return type is *dict*.

$lib.inet.http.oauth.v2.getUserAccessToken(iden)

Get the provider access token for the current user.

Example:

Retrieve the token and handle needing an auth code:

```
$provideriden = $lib.globals.get("oauth:myprovider")

($ok, $data) = $lib.inet.http.oauth.v2.getUserAccessToken($provideriden)

if $ok {
    // $data is the token to be used in a request
else {
    // $data is a message stating why the token is not available
    // caller should now handle retrieving a new auth code for the user
}
```

Args:
iden (str): The provider iden.

Returns:
List of (<bool>, <token/mesg>) for status and data. The return type is *list*.

$lib.inet.http.oauth.v2.listProviders()

List provider configurations

Returns:
List of (iden, conf) tuples. The return type is *list*.

$lib.inet.http.oauth.v2.setUserAuthCode(iden, authcode, code_verifier=$lib.null)

Set the auth code for the current user.

Args:
iden (str): The provider iden.

authcode (str): The auth code for the user.

code_verifier (str): Optional PKCE code verifier.

Returns:
The return type is `null`.

13.1.37 $lib.inet.imap

A Storm library to connect to an IMAP server.

$lib.inet.imap.connect(host, port=(993), timeout=(30), ssl=$lib.true)

Open a connection to an IMAP server.

This method will wait for a "hello" response from the server before returning the `inet:imap:server` instance.

Args:
host (str): The IMAP hostname.

port (int): The IMAP server port.

timeout (int): The time to wait for all commands on the server to execute.

ssl (bool): Use SSL to connect to the IMAP server.

Returns:
A new `inet:imap:server` instance. The return type is *inet:imap:server*.

13.1.38 $lib.inet.ipv6

A Storm Library for providing ipv6 helpers.

$lib.inet.ipv6.expand(valu)

Convert a IPv6 address to its expanded form.'

Notes:
The expanded form is also sometimes called the "long form" address.

Examples:
Expand a ipv6 address to its long form:

```
$expandedvalu = $lib.inet.ipv6.expand('2001:4860:4860::8888')
```

Args:
valu (str): IPv6 Address to expand

Returns:
The expanded form. The return type is *str*.

13.1.39 $lib.inet.smtp

A Storm Library for sending email messages via SMTP.

$lib.inet.smtp.message()

Construct a new email message.

Returns:
The newly constructed inet:smtp:message. The return type is *inet:smtp:message*.

13.1.40 $lib.inet.whois

A Storm Library for providing a consistent way to generate guids for WHOIS / Registration Data in Storm.

$lib.inet.whois.guid(props, form)

Provides standard patterns for creating guids for certain inet:whois forms.

Raises:
StormRuntimeError: If form is not supported in this method.

Args:
props (dict): Dictionary of properties used to create the form.

form (str): The `inet:whois` form to create the guid for.

Returns:
A guid for creating a the node for. The return type is *str*.

13.1.41 $lib.infosec.cvss

A Storm library which implements CVSS score calculations.

$lib.infosec.cvss.calculate(node, save=$lib.true, vers=3.1)

Calculate the CVSS score values for an input risk:vuln node.

Args:
node (node): A risk:vuln node from the Storm runtime.

save (boolean): If true, save the computed scores to the node properties.

vers (str): The version of CVSS calculations to execute.

Returns:
A dictionary containing the computed score and subscores. The return type is *dict*.

$lib.infosec.cvss.calculateFromProps(props, vers=3.1)

Calculate the CVSS score values from a props dict.

Args:
props (dict): A props dictionary.

vers (str): The version of CVSS calculations to execute.

Returns:
A dictionary containing the computed score and subscores. The return type is *dict*.

$lib.infosec.cvss.saveVectToNode(node, text)

Parse a CVSS v3.1 vector and record properties on a risk:vuln node.

Args:
node (node): A risk:vuln node to record the CVSS properties on.

text (str): A CVSS vector string.

Returns:
The return type is `null`.

$lib.infosec.cvss.vectToProps(text)

Parse a CVSS v3.1 vector and return a dictionary of risk:vuln props.

Args:
text (str): A CVSS vector string.

Returns:
A dictionary of risk:vuln secondary props. The return type is *dict*.

$lib.infosec.cvss.vectToScore(vect, vers=$lib.null)

Compute CVSS scores from a vector string.

Takes a CVSS vector string, attempts to automatically detect the version (defaults to CVSS3.1 if it cannot), and calculates the base, temporal, and environmental scores.

Raises:

- BadArg: An invalid *vers* string is provided
- BadDataValu: The vector string is invalid in some way. Possible reasons are malformed string, duplicated metrics, missing mandatory metrics, and invalid metric values.

Args:

vect (str):
A valid CVSS vector string.

The following examples are valid formats:

- CVSS 2 with version: *CVSS2#AV:L/AC:L/Au:M/C:P/I:C/A:N*
- CVSS 2 with parentheses: *(AV:L/AC:L/Au:M/C:P/I:C/A:N)*
- CVSS 2 without parentheses: *AV:L/AC:L/Au:M/C:P/I:C/A:N*
- CVSS 3.0 with version: *CVSS:3.0/AV:N/AC:H/PR:L/UI:R/S:U/C:L/I:L/A:L*
- CVSS 3.1 with version: *CVSS:3.1/AV:N/AC:H/PR:L/UI:R/S:U/C:L/I:L/A:L*
- CVSS 3.0/3.1 with parentheses: *(AV:N/AC:H/PR:L/UI:R/S:U/C:L/I:L/A:L)*
- CVSS 3.0/3.1 without parentheses: *AV:N/AC:H/PR:L/UI:R/S:U/C:L/I:L/A:L*

vers (str):
A valid version string or None to autodetect the version from the vector string. Accepted values are: 2, 3.0, 3.1, None.

Returns:

A dictionary with the detected version, base score, temporal score, environmental score, overall score, and normalized vector string. The normalized vector string will have metrics ordered in specification order and metrics with undefined values will be removed. Example:

```
{
    'version': '3.1',
    'score': 4.3,
    'base': 5.0,
    'temporal': 4.4,
    'environmental': 4.3,
    'normalized': 'AV:N/AC:H/PR:L/UI:R/S:U/C:L/I:L/A:L'
}
```

The return type is *dict*.

13.1.42 $lib.infosec.mitre.attack.flow

A Storm library which implements modeling MITRE ATT&CK Flow diagrams.

$lib.infosec.mitre.attack.flow.ingest(flow)

Ingest a MITRE ATT&CK Flow diagram in JSON format.

Args:
flow (data): The JSON data to ingest.

Returns:
The it:mitre:attack:flow node representing the ingested attack flow diagram. The return type may be one of the following: *node*, `null`.

$lib.infosec.mitre.attack.flow.norm(flow)

Normalize a MITRE ATT&CK Flow diagram in JSON format.

Args:
flow (data): The MITRE ATT&CK Flow diagram in JSON format to normalize (flatten and sort).

Returns:
The normalized MITRE ATT&CK Flow diagram. The return type is *dict*.

13.1.43 $lib.iters

A Storm library for providing iterator helpers.

$lib.iters.enum(genr)

Yield (<indx>, <item>) tuples from an iterable or generator.

Args:
genr (iter): An iterable or generator.

Yields:
Yields (<indx>, <item>) tuples. The return type is *list*.

$lib.iters.zip(*args)

Yield tuples created by iterating multiple iterables in parallel.

Args:
*args (iter): Iterables or generators.

Yields:
Yields tuples with an item from each iterable or generator. The return type is *list*.

13.1.44 $lib.json

A Storm Library for interacting with Json data.

$lib.json.load(text)

Parse a JSON string and return the deserialized data.

Args:
text (str): The string to be deserialized.

Returns:
The JSON deserialized object. The return type is `prim`.

$lib.json.save(item)

Save an object as a JSON string.

Args:
item (any): The item to be serialized as a JSON string.

Returns:
The JSON serialized object. The return type is *str*.

$lib.json.schema(schema, use_default=$lib.true)

Get a JS schema validation object.

Args:
schema (dict): The JsonSchema to use.

use_default (boolean): Whether to insert default schema values into the validated data structure.

Returns:
A validation object that can be used to validate data structures. The return type is *json:schema*.

13.1.45 $lib.jsonstor

Implements cortex JSON storage.

$lib.jsonstor.cachedel(path, key)

Remove cached data set with cacheset.

Args:
path (str|list): The base path to use for the cache key.

key (prim): The value to use for the GUID cache key.

Returns:
True if the del operation was successful. The return type is *boolean*.

$lib.jsonstor.cacheget(path, key, asof=now, envl=$lib.false)

Retrieve data stored with cacheset() if it was stored more recently than the asof argument.

Args:
path (str|list): The base path to use for the cache key.

key (prim): The value to use for the GUID cache key.

asof (time): The max cache age.

envl (boolean): Return the full cache envelope.

Returns:
The cached value (or envelope) or null. The return type is `prim`.

$lib.jsonstor.cacheset(path, key, valu)

Set cache data with an envelope that tracks time for cacheget() use.

Args:
path (str|list): The base path to use for the cache key.

key (prim): The value to use for the GUID cache key.

valu (prim): The data to store.

Returns:
The cached asof time and path. The return type is *dict*.

$lib.jsonstor.del(path, prop=$lib.null)

Delete a stored JSON object or object.

Args:
path (str|list): A path string or list of path parts.

prop (str|list): A property name or list of name parts.

Returns:
True if the del operation was successful. The return type is *boolean*.

$lib.jsonstor.get(path, prop=$lib.null)

Return a stored JSON object or object property.

Args:
path (str|list): A path string or list of path parts.

prop (str|list): A property name or list of name parts.

Returns:
The previously stored value or $lib.null The return type is `prim`.

$lib.jsonstor.iter(path=$lib.null)

Yield (<path>, <valu>) tuples for the JSON objects.

Args:
path (str|list): A path string or list of path parts.

Yields:
(<path>, <item>) tuples. The return type is *list*.

$lib.jsonstor.set(path, valu, prop=$lib.null)

Set a JSON object or object property.

Args:
path (str|list): A path string or list of path elements.

valu (prim): The value to set as the JSON object or object property.

prop (str|list): A property name or list of name parts.

Returns:
True if the set operation was successful. The return type is *boolean*.

13.1.46 $lib.layer

A Storm Library for interacting with Layers in the Cortex.

$lib.layer.add(ldef=$lib.null)

Add a layer to the Cortex.

Args:
ldef (dict): The layer definition dictionary.

Returns:
A `layer` object representing the new layer. The return type is *layer*.

$lib.layer.del(iden)

Delete a layer from the Cortex.

Args:
iden (str): The iden of the layer to delete.

Returns:
The return type is `null`.

$lib.layer.get(iden=$lib.null)

Get a Layer from the Cortex.

Args:
iden (str): The iden of the layer to get. If not set, this defaults to the top layer of the current View.

Returns:
The storm layer object. The return type is *layer*.

$lib.layer.list()

List the layers in a Cortex

Returns:
List of `layer` objects. The return type is *list*.

13.1.47 $lib.lift

A Storm Library for interacting with lift helpers.

$lib.lift.byNodeData(name)

Lift nodes which have a given nodedata name set on them.

Args:
name (str): The name to of the nodedata key to lift by.

Yields:
Yields nodes to the pipeline. This must be used in conjunction with the `yield` keyword. The return type is *node*.

13.1.48 $lib.log

A Storm library which implements server side logging. These messages are logged to the `synapse.storm.log` logger.

$lib.log.debug(mesg, extra=$lib.null)

Log a message to the Cortex at the debug log level.

Notes:
This requires the `storm.lib.log.debug` permission to use.

Examples:
Log a debug message:

```
$lib.log.debug('I am a debug message!')
```

Log a debug message with extra information:

```
$lib.log.debug('Extra information included here.', extra=({"key": $valu}))
```

Args:
mesg (str): The message to log.

extra (dict): Extra key / value pairs to include when structured logging is enabled on the Cortex.

Returns:
The return type is `null`.

$lib.log.error(mesg, extra=$lib.null)

Log a message to the Cortex at the error log level.

Notes:
This requires the `storm.lib.log.error` permission to use.

Examples:
Log an error message:

```
$lib.log.error('I am a error message!')
```

Log an error message with extra information:

```
$lib.log.error('Extra information included here.', extra=({"key": $valu}))
```

Args:
mesg (str): The message to log.

extra (dict): Extra key / value pairs to include when structured logging is enabled on the Cortex.

Returns:
The return type is `null`.

$lib.log.info(mesg, extra=$lib.null)

Log a message to the Cortex at the info log level.

Notes:
This requires the `storm.lib.log.info` permission to use.

Examples:
Log an info message:

```
$lib.log.info('I am a info message!')
```

Log an info message with extra information:

```
$lib.log.info('Extra information included here.', extra=({"key": $valu}))
```

Args:
mesg (str): The message to log.

extra (dict): Extra key / value pairs to include when structured logging is enabled on the Cortex.

Returns:
The return type is `null`.

$lib.log.warning(mesg, extra=$lib.null)

Log a message to the Cortex at the warning log level.

Notes:
This requires the `storm.lib.log.warning` permission to use.

Examples:
Log a warning message:

```
$lib.log.warning('I am a warning message!')
```

Log a warning message with extra information:

```
$lib.log.warning('Extra information included here.', extra=({"key": $valu}))
```

Args:
mesg (str): The message to log.

extra (dict): Extra key / value pairs to include when structured logging is enabled on the Cortex.

Returns:
The return type is `null`.

13.1.49 $lib.macro

A Storm Library for interacting with the Storm Macros in the Cortex.

$lib.macro.del(name)

Delete a Storm Macro by name from the Cortex.

Args:
name (str): The name of the macro to delete.

Returns:
The return type is `null`.

$lib.macro.get(name)

Get a Storm Macro definition by name from the Cortex.

Args:
name (str): The name of the macro to get.

Returns:
A macro definition. The return type is *dict*.

$lib.macro.grant(name, scope, iden, level)

Modify permissions granted to users/roles on a Storm Macro.

Args:
name (str): Name of the Storm Macro to modify.

scope (str): The scope, either "users" or "roles".

iden (str): The user/role iden depending on scope.

level (int): The permission level number.

Returns:
The return type is `null`.

$lib.macro.list()

Get a list of Storm Macros in the Cortex.

Returns:
A list of `dict` objects containing Macro definitions. The return type is *list*.

$lib.macro.mod(name, info)

Modify user editable properties of a Storm Macro.

Args:
name (str): Name of the Storm Macro to modify.

info (dict): A dictionary of the properties to edit.

Returns:
The return type is `null`.

$lib.macro.set(name, storm)

Add or modify an existing Storm Macro in the Cortex.

Args:
name (str): Name of the Storm Macro to add or modify.

storm: The Storm query to add to the macro. The input type may be one of the following: `str`, `storm:query`.

Returns:
The return type is `null`.

13.1.50 $lib.math

A Storm library for performing math operations.

$lib.math.number(value)

Convert a value to a Storm Number object.

Storm Numbers are high precision fixed point decimals corresponding to the hugenum storage type.

This is not to be used for converting a string to an integer.

Args:
value (any): Value to convert.

Returns:
A Number object. The return type is *number*.

13.1.51 $lib.mime.html

A Storm library for manipulating HTML text.

$lib.mime.html.totext(html)

Return inner text from all tags within an HTML document.

Args:
html (str): The HTML text to be parsed.

Returns:
The newline-joined inner HTML text. The return type is *str*.

13.1.52 $lib.model

A Storm Library for interacting with the Data Model in the Cortex.

$lib.model.form(name)

Get a form object by name.

Args:
name (str): The name of the form to retrieve.

Returns:
The `model:form` instance if the form is present or null. The return type may be one of the following: *model:form*, `null`.

$lib.model.prop(name)

Get a prop object by name.

Args:
name (str): The name of the prop to retrieve.

Returns:
The `model:property` instance if the type if present or null. The return type may be one of the following: *model:property*, `null`.

$lib.model.tagprop(name)

Get a tag property object by name.

Args:
name (str): The name of the tag prop to retrieve.

Returns:
The `model:tagprop` instance if the tag prop if present or null. The return type may be one of the following: *model:tagprop*, `null`.

$lib.model.type(name)

Get a type object by name.

Args:
name (str): The name of the type to retrieve.

Returns:
The `model:type` instance if the type if present on the form or null. The return type may be one of the following: *model:type*, `null`.

13.1.53 $lib.model.deprecated

A storm library for interacting with the model deprecation mechanism.

$lib.model.deprecated.lock(name, locked)

Set the locked property for a deprecated model element.

Args:
name (str): The full path of the model element to lock.

locked (boolean): The lock status.

Returns:
The return type is `null`.

$lib.model.deprecated.locks()

Get a dictionary of the data model elements which are deprecated and their lock status in the Cortex.

Returns:
A dictionary of named elements to their boolean lock values. The return type is *dict*.

13.1.54 $lib.model.edge

A Storm Library for interacting with light edges and manipulating their key-value attributes.

$lib.model.edge.del(verb, key)

Delete a key from the key-value store for a verb.

Args:
verb (str): The name of the Edge verb to remove a key from.

key (str): The name of the key to remove from the key-value store.

Returns:
The return type is `null`.

$lib.model.edge.get(verb)

Get the key-value data for a given Edge verb.

Args:
verb (str): The Edge verb to look up.

Returns:
A dictionary representing the key-value data set on a verb. The return type is *dict*.

$lib.model.edge.list()

Get a list of (verb, key-value dictionary) pairs for Edge verbs in the current Cortex View.

Returns:
A list of (str, dict) tuples for each verb in the current Cortex View. The return type is *list*.

$lib.model.edge.set(verb, key, valu)

Set a key-value for a given Edge verb.

Args:
verb (str): The Edge verb to set a value for.

key (str): The key to set.

valu (str): The value to set.

Returns:
The return type is `null`.

$lib.model.edge.validkeys()

Get a list of the valid keys that can be set on an Edge verb.

Returns:
A list of the valid keys. The return type is *list*.

13.1.55 $lib.model.ext

A Storm library for manipulating extended model elements.

$lib.model.ext.addExtModel(model)

Add extended model elements to the Cortex from getExtModel().

Args:
model (dict): A model dictionary from getExtModel().

Returns:
The return type is *boolean*.

$lib.model.ext.addForm(formname, basetype, typeopts, typeinfo)

Add an extended form definition to the data model.

Args:
formname (str): The name of the form to add.

basetype (str): The base type the form is derived from.

typeopts (dict): A Synapse type opts dictionary.

typeinfo (dict): A Synapse form info dictionary.

Returns:
The return type is `null`.

$lib.model.ext.addFormProp(formname, propname, typedef, propinfo)

Add an extended property definition to the data model.

Args:
formname (str): The name of the form to add the property to.

propname (str): The name of the extended property.

typedef (list): A Synapse type definition tuple.

propinfo (dict): A synapse property definition dictionary.

Returns:
The return type is `null`.

$lib.model.ext.addTagProp(propname, typedef, propinfo)

Add an extended tag property definition to the data model.

Args:

propname (str): The name of the tag property.

typedef (list): A Synapse type definition tuple.

propinfo (dict): A synapse property definition dictionary.

Returns:

The return type is `null`.

$lib.model.ext.addUnivProp(propname, typedef, propinfo)

Add an extended universal property definition to the data model.

Args:

propname (str): The name of the universal property.

typedef (list): A Synapse type definition tuple.

propinfo (dict): A synapse property definition dictionary.

Returns:

The return type is `null`.

$lib.model.ext.delForm(formname)

Remove an extended form definition from the model.

Args:

formname (str): The extended form to remove.

Returns:

The return type is `null`.

$lib.model.ext.delFormProp(formname, propname)

Remove an extended property definition from the model.

Args:

formname (str): The form with the extended property.

propname (str): The extended property to remove.

Returns:

The return type is `null`.

$lib.model.ext.delTagProp(propname)

Remove an extended tag property definition from the model.

Args:
propname (str): Name of the tag property to remove.

Returns:
The return type is `null`.

$lib.model.ext.delUnivProp(propname)

Remove an extended universal property definition from the model.

Args:
propname (str): Name of the universal property to remove.

Returns:
The return type is `null`.

$lib.model.ext.getExtModel()

Get all extended model elements.

Returns:
The return type is *dict*.

13.1.56 $lib.model.tags

A Storm Library for interacting with tag specifications in the Cortex Data Model.

$lib.model.tags.del(tagname)

Delete a tag model specification.

Examples:
Delete the tag model specification for `cno.threat`:

```
$lib.model.tags.del(cno.threat)
```

Args:
tagname (str): The name of the tag.

Returns:
The return type is `null`.

$lib.model.tags.get(tagname)

Retrieve a tag model specification.

Examples:

Get the tag model specification for `cno.threat`:

```
$dict = $lib.model.tags.get(cno.threat)
```

Args:

tagname (str): The name of the tag.

Returns:

The tag model definition. The return type is *dict*.

$lib.model.tags.list()

List all tag model specifications.

Examples:

Iterate over the tag model specifications in the Cortex:

```
for ($name, $info) in $lib.model.tags.list() {
    ...
}
```

Returns:

List of tuples containing the tag name and model definition The return type is *list*.

$lib.model.tags.pop(tagname, propname)

Pop and return a tag model property.

Examples:

Remove the regex list from the `cno.threat` tag model:

```
$regxlist = $lib.model.tags.pop(cno.threat, regex)
```

Args:

tagname (str): The name of the tag.

propname (str): The name of the tag model property.

Returns:

The value of the property. The return type is `prim`.

$lib.model.tags.set(tagname, propname, propvalu)

Set a tag model property for a tag.

Examples:
Create a tag model for the `cno.cve` tag:

```
$regx = ($lib.null, $lib.null, "[0-9]{4}", "[0-9]{5}")
$lib.model.tags.set(cno.cve, regex, $regx)
```

Args:
tagname (str): The name of the tag.

propname (str): The name of the tag model property.

propvalu (prim): The value to set.

Returns:
The return type is `null`.

13.1.57 $lib.notifications

A Storm library for a user interacting with their notifications.

$lib.notifications.del(indx)

Delete a previously delivered notification.

Args:
indx (int): The index number of the notification to delete.

Retn:
Returns an ($ok, $valu) tuple. The return type is *list*.

$lib.notifications.get(indx)

Return a notification by ID (or $lib.null).

Args:
indx (int): The index number of the notification to return.

Retn:
The requested notification or $lib.null. The return type is *dict*.

$lib.notifications.list(size=$lib.null)

Yield (<indx>, <mesg>) tuples for a user's notifications.

Args:
size (int): The max number of notifications to yield.

Yields:
Yields (useriden, time, mesgtype, msgdata) tuples. The return type is *list*.

13.1.58 $lib.pack

Packing / unpacking structured bytes.

$lib.pack.en(fmt, items)

Pack a sequence of items into an array of bytes.

Args:

fmt (str): A python struct.pack() format string.

items (list): A list of values to be packed.

Returns:

The packed byte structure. The return type is *bytes*.

$lib.pack.un(fmt, byts, offs=(0))

Unpack a sequence of items from an array of bytes.

Args:

fmt (str): A python struct.unpack() format string.

byts (bytes): Bytes to be unpacked

offs (int): The offset to begin unpacking from.

Returns:

The unpacked items. The return type is *list*.

13.1.59 $lib.pipe

A Storm library for interacting with non-persistent queues.

$lib.pipe.gen(filler, size=(10000))

Generate and return a Storm Pipe.

Notes:

The filler query is run in parallel with $pipe. This requires the permission `storm.pipe.gen` to use.

Examples:

Fill a pipe with a query and consume it with another:

```
$pipe = $lib.pipe.gen(${ $pipe.puts((1, 2, 3)) })

for $items in $pipe.slices(size=2) {
    $dostuff($items)
}
```

Args:

filler: A Storm query to fill the Pipe. The input type may be one of the following: `str`, `storm:query`.

size (int): Maximum size of the pipe.

Returns:

The pipe containing query results. The return type is *pipe*.

13.1.60 $lib.pkg

A Storm Library for interacting with Storm Packages.

$lib.pkg.add(pkgdef, verify=$lib.false)

Add a Storm Package to the Cortex.

Args:
  pkgdef (dict): A Storm Package definition.

  verify (boolean): Verify storm package signature.

Returns:
  The return type is `null`.

$lib.pkg.del(name)

Delete a Storm Package from the Cortex.

Args:
  name (str): The name of the package to delete.

Returns:
  The return type is `null`.

$lib.pkg.deps(pkgdef)

Verify the dependencies for a Storm Package.

Args:
  pkgdef (dict): A Storm Package definition.

Returns:
  A dictionary listing dependencies and if they are met. The return type is *dict*.

$lib.pkg.get(name)

Get a Storm Package from the Cortex.

Args:
  name (str): A Storm Package name.

Returns:
  The Storm package definition. The return type is *dict*.

$lib.pkg.has(name)

Check if a Storm Package is available in the Cortex.

Args:
name (str): A Storm Package name to check for the existence of.

Returns:
True if the package exists in the Cortex, False if it does not. The return type is *boolean*.

$lib.pkg.list()

Get a list of Storm Packages loaded in the Cortex.

Returns:
A list of Storm Package definitions. The return type is *list*.

13.1.61 $lib.projects

A Storm Library for interacting with Projects in the Cortex.

$lib.projects.add(name, desc=)

Add a new project

Args:
name (str): The name of the Project to add

desc (str): A description of the overall project

Returns:
The newly created *proj:project* object The return type is *proj:project*.

$lib.projects.del(name)

Delete an existing project

Args:
name (str): The name of the Project to delete

Returns:
True if the project exists and gets deleted, otherwise False The return type is *boolean*.

$lib.projects.get(name)

Retrieve a project by name

Args:
name (str): The name of the Project to get

Returns:
The *proj:project `object, if it exists, otherwise null The return type is :ref:`stormprims-proj-project-f527*.

13.1.62 $lib.ps

A Storm Library for interacting with running tasks on the Cortex.

$lib.ps.kill(prefix)

Stop a running task on the Cortex.

Args:
prefix (str): The prefix of the task to stop. Tasks will only be stopped if there is a single prefix match.

Returns:
True if the task was cancelled, False otherwise. The return type is *boolean*.

$lib.ps.list()

List tasks the current user can access.

Returns:
A list of task definitions. The return type is *list*.

13.1.63 $lib.queue

A Storm Library for interacting with persistent Queues in the Cortex.

$lib.queue.add(name)

Add a Queue to the Cortex with a given name.

Args:
name (str): The name of the queue to add.

Returns:
The return type is *queue*.

$lib.queue.del(name)

Delete a given named Queue.

Args:
name (str): The name of the queue to delete.

Returns:
The return type is `null`.

$lib.queue.gen(name)

Add or get a Storm Queue in a single operation.

Args:
name (str): The name of the Queue to add or get.

Returns:
The return type is *queue*.

$lib.queue.get(name)

Get an existing Storm Queue object.

Args:
name (str): The name of the Queue to get.

Returns:
A `queue` object. The return type is *queue*.

$lib.queue.list()

Get a list of the Queues in the Cortex.

Returns:
A list of queue definitions the current user is allowed to interact with. The return type is *list*.

13.1.64 $lib.random

A Storm library for generating random values.

$lib.random.int(maxval, minval=(0))

Generate a random integer.

Args:
maxval (int): The maximum random value.

minval (int): The minimum random value.

Returns:
A random integer in the range min-max inclusive. The return type is `int`.

13.1.65 $lib.regex

A Storm library for searching/matching with regular expressions.

$lib.regex.escape(text)

Escape arbitrary strings for use in a regular expression pattern.

Example:

Escape node values for use in a regex pattern:

```
for $match in $lib.regex.findall($lib.regex.escape($node.repr()), $mydocument)
↪{
    // do something with $match
}
```

Escape node values for use in regular expression filters:

```
it:dev:str~=$lib.regex.escape($node.repr())
```

Args:
text (str): The text to escape.

Returns:
Input string with special characters escaped. The return type is *str*.

$lib.regex.findall(pattern, text, flags=(0))

Search the given text for the patterns and return a list of matching strings.

Note:
If multiple matching groups are specified, the return value is a list of lists of strings.

Example:

Extract the matching strings from a piece of text:

```
for $x in $lib.regex.findall("G[0-9]{4}", "G0006 and G0001") {
    $dostuff($x)
}
```

Args:
pattern (str): The regular expression pattern.

text (str): The text to match.

flags (int): Regex flags to control the match behavior.

Returns:
A list of lists of strings for the matching groups in the pattern. The return type is *list*.

$lib.regex.flags.i

Regex flag to indicate that case insensitive matches are allowed.

Returns:
The type is `int`.

$lib.regex.flags.m

Regex flag to indicate that multiline matches are allowed.

Returns:
The type is `int`.

$lib.regex.matches(pattern, text, flags=(0))

Check if text matches a pattern. Returns $lib.true if the text matches the pattern, otherwise $lib.false.

Notes:
This API requires the pattern to match at the start of the string.

Example:
Check if the variable matches a expression:

```
if $lib.regex.matches("^[0-9]+.[0-9]+.[0-9]+$", $text) {
    $lib.print("It's semver! ...probably")
}
```

Args:
pattern (str): The regular expression pattern.

text (str): The text to match.

flags (int): Regex flags to control the match behavior.

Returns:
True if there is a match, False otherwise. The return type is *boolean*.

$lib.regex.replace(pattern, replace, text, flags=(0))

Replace any substrings that match the given regular expression with the specified replacement.

Example:
Replace a portion of a string with a new part based on a regex:

```
$norm = $lib.regex.replace("\sAND\s", " & ", "Ham and eggs!", $lib.regex.flags.i)
```

Args:
pattern (str): The regular expression pattern.

replace (str): The text to replace matching sub strings.

text (str): The input text to search/replace.

flags (int): Regex flags to control the match behavior.

Returns:
The new string with matches replaced. The return type is *str*.

$lib.regex.search(pattern, text, flags=(0))

Search the given text for the pattern and return the matching groups.

Note:
In order to get the matching groups, patterns must use parentheses to indicate the start and stop of the regex to return portions of. If groups are not used, a successful match will return a empty list and a unsuccessful match will return `$lib.null`.

Example:
Extract the matching groups from a piece of text:

```
$m = $lib.regex.search("^([0-9])+.([0-9])+.([0-9])+$", $text)
if $m {
    ($maj, $min, $pat) = $m
}
```

Args:
pattern (str): The regular expression pattern.

text (str): The text to match.

flags (int): Regex flags to control the match behavior.

Returns:
A list of strings for the matching groups in the pattern. The return type is *list*.

13.1.66 $lib.scrape

A Storm Library for providing helpers for scraping nodes from text.

$lib.scrape.context(text)

Attempt to scrape information from a blob of text, getting the context information about the values found.

Notes:
This does call the `scrape` Storm interface if that behavior is enabled on the Cortex.

Examples:
Scrape some text and make nodes out of it:

```
for ($form, $valu, $info) in $lib.scrape.context($text) {
    [ ( *$form ?= $valu ) ]
}
```

Args:
text (str): The text to scrape

Yields:
A dictionary of scraped values, rule types, and offsets scraped from the text. The return type is *dict*.

$lib.scrape.genMatches(text, pattern, fangs=$lib.null, flags=(2))

genMatches is a generic helper function for constructing scrape interfaces using pure Storm.

It accepts the text, a regex pattern, and produce results that can easily be used to create

Notes:
The pattern must have a named regular expression match for the key `valu` using the named group syntax. For example `(somekey\s)(?P<valu>[a-z0-9]+)\s`.

Examples:
A scrape implementation with a regex that matches name keys in text:

```
$re="(Name\:\s)(?P<valu>[a-z0-9]+)\s"
$form="ps:name"

function scrape(text, form) {
        $ret = $lib.list()
        for ($valu, $info) in $lib.scrape.genMatches($text, $re) {
            $ret.append(($form, $valu, $info))
        }
        return ( $ret )
    }
```

Args:
text (str): The text to scrape

pattern (str): The regular expression pattern to match against.

fangs (list): A list of (src, dst) pairs to refang from text. The src must be equal or larger than the dst in length.

flags (int): Regex flags to use (defaults to IGNORECASE).

Yields:
The return type is *list*.

$lib.scrape.ndefs(text)

Attempt to scrape node form, value tuples from a blob of text.

Examples:
Scrape some text and attempt to make nodes out of it:

```
for ($form, $valu) in $lib.scrape($text) {
    [ ( *$form ?= $valu ) ]
}
```

Args:
text (str): The text to scrape

Yields:
A list of (form, value) tuples scraped from the text. The return type is *list*.

13.1.67 $lib.service

A Storm Library for interacting with Storm Services.

$lib.service.add(name, url)

Add a Storm Service to the Cortex.

Args:
name (str): Name of the Storm Service to add.

url (str): The Telepath URL to the Storm Service.

Returns:
The Storm Service definition. The return type is *dict*.

$lib.service.del(iden)

Remove a Storm Service from the Cortex.

Args:
iden (str): The iden of the service to remove.

Returns:
The return type is `null`.

$lib.service.get(name)

Get a Storm Service definition.

Args:
name (str): The local name, local iden, or remote name, of the service to get the definition for.

Returns:
A Storm Service definition. The return type is *dict*.

$lib.service.has(name)

Check if a Storm Service is available in the Cortex.

Args:
name (str): The local name, local iden, or remote name, of the service to check for the existence of.

Returns:
True if the service exists in the Cortex, False if it does not. The return type is *boolean*.

$lib.service.list()

List the Storm Service definitions for the Cortex.

Notes:
The definition dictionaries have an additional `ready` key added to them to indicate if the Cortex is currently connected to the Storm Service or not.

Returns:
A list of Storm Service definitions. The return type is *list*.

$lib.service.wait(name, timeout=$lib.null)

Wait for a given service to be ready.

Notes:
If a timeout value is not specified, this will block a Storm query until the service is available.

Args:
name (str): The name, or iden, of the service to wait for.

timeout (int): Number of seconds to wait for the service.

Returns:
Returns true if the service is available, false on a timeout waiting for the service to be ready. The return type is *boolean*.

13.1.68 $lib.spooled

A Storm Library for interacting with Spooled Objects.

$lib.spooled.set(*vals)

Get a Spooled Storm Set object.

A Spooled Storm Set object is memory-safe to grow to extraordinarily large sizes, as it will fallback to file backed storage, with two restrictions. First is that all items in the set can be serialized to a file if the set grows too large, so all items added must be a serializable Storm primitive. Second is that when an item is added to the Set, because it could be immediately written disk, do not hold any references to it outside of the Set itself, as the two objects could differ.

Args:
*vals (any): Initial values to place in the set.

Returns:
The new set. The return type is *set*.

13.1.69 $lib.stats

A Storm Library for statistics related functionality.

$lib.stats.tally()

Get a Tally object.

Returns:
A new tally object. The return type is *stat:tally*.

13.1.70 $lib.stix

A Storm Library for interacting with Stix Version 2.1 CS02.

$lib.stix.lift(bundle)

Lift nodes from a STIX Bundle made by Synapse.

Notes:
This lifts nodes using the Node definitions embedded into the bundle when created by Synapse using custom extension properties.

Examples:
Lifting nodes from a STIX bundle:

```
yield $lib.stix($bundle)
```

Args:
bundle (dict): The STIX bundle to lift nodes from.

Yields:
Yields nodes The return type is *node*.

$lib.stix.validate(bundle)

Validate a STIX Bundle.

Notes:
This returns a dictionary containing the following values:

```
{
    'ok': <boolean> - False if bundle is invalid, True otherwise.
    'mesg': <str> - An error message if there was an error when validating the␣
↪bundle.
    'results': The results of validating the bundle.
}
```

Args:
bundle (dict): The stix bundle to validate.

Returns:
Results dictionary. The return type is *dict*.

13.1.71 $lib.stix.export

A Storm Library for exporting to STIX version 2.1 CS02.

$lib.stix.export.bundle(config=$lib.null)

Return a new empty STIX bundle.

The config argument maps synapse forms to stix types and allows you to specify how to resolve STIX properties and relationships. The config expects to following format:

```
{
    "maxsize": 10000,

    "forms": {
        <formname>: {
            "default": <stixtype0>,
            "stix": {
                <stixtype0>: {
                    "props": {
                        <stix_prop_name>: <storm_with_return>,
                        ...
                    },
                    "rels": (
                        ( <relname>, <target_stixtype>, <storm> ),
                        ...
                    ),
                    "revs": (
                        ( <revname>, <source_stixtype>, <storm> ),
                        ...
                    )
                },
                <stixtype1>: ...
            },
        },
    },
},
```

For example, the default config includes the following entry to map ou:campaign nodes to stix campaigns:

```
{ "forms": {
    "ou:campaign": {
        "default": "campaign",
        "stix": {
            "campaign": {
                "props": {
                    "name": "{+:name return(:name)} return($node.repr())",
                    "description": "+:desc return(:desc)",
                    "objective": "+:goal :goal -> ou:goal +:name return(:name)",
                    "created": "return($lib.stix.export.timestamp(.created))",
                    "modified": "return($lib.stix.export.timestamp(.created))",
                },
                "rels": (
```

(continues on next page)

(continued from previous page)

```
                    ("attributed-to", "threat-actor", ":org -> ou:org"),
                    ("originates-from", "location", ":org -> ou:org :hq -> geo:place"),
                    ("targets", "identity", "-> risk:attack :target:org -> ou:org"),
                    ("targets", "identity", "-> risk:attack :target:person -> ps:person
↪"),
                ),
            },
        },
}},
```

You may also specify pivots on a per form+stixtype basis to automate pivoting to additional nodes to include in the bundle:

```
{"forms": {
    "inet:fqdn":
        ...
        "domain-name": {
            ...
            "pivots": [
                {"storm": "-> inet:dns:a -> inet:ipv4", "stixtype": "ipv4-addr"}
            ]
        {
    }
}
```

Note:
The default config is an evolving set of mappings. If you need to guarantee stable output please specify a config.

Args:
config (dict): The STIX bundle export config to use.

Returns:
A new `stix:bundle` instance. The return type is *stix:bundle*.

$lib.stix.export.config()

Construct a default STIX bundle export config.

Returns:
A default STIX bundle export config. The return type is *dict*.

$lib.stix.export.timestamp(tick)

Format an epoch milliseconds timestamp for use in STIX output.

Args:
tick (time): The epoch milliseconds timestamp.

Returns:
A STIX formatted timestamp string. The return type is *str*.

13.1.72 $lib.stix.import

A Storm Library for importing Stix Version 2.1 data.

$lib.stix.import.config()

Return an editable copy of the default STIX ingest config.

Returns:
A copy of the default STIX ingest configuration. The return type is *dict*.

$lib.stix.import.ingest(bundle, config=$lib.null)

Import nodes from a STIX bundle.

Args:
bundle (dict): The STIX bundle to ingest.

config (dict): An optional STIX ingest configuration.

Yields:
Yields nodes The return type is *node*.

13.1.73 $lib.storm

A Storm library for evaluating dynamic storm expressions.

$lib.storm.eval(text, cast=$lib.null)

Evaluate a storm runtime value and optionally cast/coerce it.

NOTE: If storm logging is enabled, the expression being evaluated will be logged separately.

Args:
text (str): A storm expression string.

cast (str): A type to cast the result to.

Returns:
The value of the expression and optional cast. The return type is `any`.

13.1.74 $lib.str

A Storm Library for interacting with strings.

$lib.str.concat(*args)

Concatenate a set of strings together.

Args:
*args (any): Items to join together.

Returns:
The joined string. The return type is *str*.

$lib.str.format(text, **kwargs)

Format a text string.

Examples:
Format a string with a fixed argument and a variable:

```
cli> storm $list=(1,2,3,4)
     $str=$lib.str.format('Hello {name}, your list is {list}!', name='Reader', list=
↪$list)
     $lib.print($str)

Hello Reader, your list is ['1', '2', '3', '4']!
```

Args:
text (str): The base text string.

**kwargs (any): Keyword values which are substituted into the string.

Returns:
The new string. The return type is *str*.

$lib.str.join(sepr, items)

Join items into a string using a separator.

Examples:
Join together a list of strings with a dot separator:

```
cli> storm $foo=$lib.str.join('.', ('rep', 'vtx', 'tag')) $lib.print($foo)

rep.vtx.tag
```

Args:
sepr (str): The separator used to join strings with.

items (list): A list of items to join together.

Returns:
The joined string. The return type is *str*.

13.1.75 $lib.tags

Storm utility functions for tags.

$lib.tags.prefix(names, prefix, ispart=$lib.false)

Normalize and prefix a list of syn:tag:part values so they can be applied.

Examples:
Add tag prefixes and then use them to tag nodes:

```
$tags = $lib.tags.prefix($result.tags, vtx.visi)
{ for $tag in $tags { [ +#$tag ] } }
```

Args:
names (list): A list of syn:tag:part values to normalize and prefix.

prefix (str): The string prefix to add to the syn:tag:part values.

ispart (boolean): Whether the names have already been normalized. Normalization will be skipped if set to true.

Returns:
A list of normalized and prefixed syn:tag values. The return type is *list*.

13.1.76 $lib.telepath

A Storm Library for making Telepath connections to remote services.

$lib.telepath.open(url)

Open and return a Telepath RPC proxy.

Args:
url (str): The Telepath URL to connect to.

Returns:
A object representing a Telepath Proxy. The return type is *telepath:proxy*.

13.1.77 $lib.time

A Storm Library for interacting with timestamps.

$lib.time.day(tick)

Returns the day part of a time value.

Args:
tick (time): A time value.

Returns:
The day part of the time expression. The return type is `int`.

$lib.time.dayofmonth(tick)

Returns the index (beginning with 0) of the day within the month.

Args:
tick (time): A time value.

Returns:
The index of the day within month. The return type is `int`.

$lib.time.dayofweek(tick)

Returns the index (beginning with monday as 0) of the day within the week.

Args:
tick (time): A time value.

Returns:
The index of the day within week. The return type is `int`.

$lib.time.dayofyear(tick)

Returns the index (beginning with 0) of the day within the year.

Args:
tick (time): A time value.

Returns:
The index of the day within year. The return type is `int`.

$lib.time.format(valu, format)

Format a Synapse timestamp into a string value using `datetime.strftime()`.

Examples:
Format a timestamp into a string:

```
cli> storm $now=$lib.time.now() $str=$lib.time.format($now, '%A %d, %B %Y') $lib.
↪print($str)

Tuesday 14, July 2020
```

Args:
valu (int): A timestamp in epoch milliseconds.

format (str): The strftime format string.

Returns:
The formatted time string. The return type is *str*.

$lib.time.fromunix(secs)

Normalize a timestamp from a unix epoch time in seconds to milliseconds.

Examples:
Convert a timestamp from seconds to millis and format it:

```
cli> storm $seconds=1594684800 $millis=$lib.time.fromunix($seconds)
     $str=$lib.time.format($millis, '%A %d, %B %Y') $lib.print($str)

Tuesday 14, July 2020
```

Args:
secs (int): Unix epoch time in seconds.

Returns:
The normalized time in milliseconds. The return type is `int`.

$lib.time.hour(tick)

Returns the hour part of a time value.

Args:
tick (time): A time value.

Returns:
The hour part of the time expression. The return type is `int`.

$lib.time.minute(tick)

Returns the minute part of a time value.

Args:
tick (time): A time value.

Returns:
The minute part of the time expression. The return type is `int`.

$lib.time.month(tick)

Returns the month part of a time value.

Args:
tick (time): A time value.

Returns:
The month part of the time expression. The return type is `int`.

$lib.time.monthofyear(tick)

Returns the index (beginning with 0) of the month within the year.

Args:
tick (time): A time value.

Returns:
The index of the month within year. The return type is `int`.

$lib.time.now()

Get the current epoch time in milliseconds.

Returns:
Epoch time in milliseconds. The return type is `int`.

$lib.time.parse(valu, format, errok=$lib.false)

Parse a timestamp string using `datetime.strptime()` into an epoch timestamp.

Examples:
Parse a string as for its month/day/year value into a timestamp:

```
cli> storm $s='06/01/2020' $ts=$lib.time.parse($s, '%m/%d/%Y') $lib.print($ts)

1590969600000
```

Args:
valu (str): The timestamp string to parse.

format (str): The format string to use for parsing.

errok (boolean): If set, parsing errors will return `$lib.null` instead of raising an exception.

Returns:
The epoch timestamp for the string. The return type is `int`.

$lib.time.second(tick)

Returns the second part of a time value.

Args:
tick (time): A time value.

Returns:
The second part of the time expression. The return type is `int`.

$lib.time.sleep(valu)

Pause the processing of data in the storm query.

Notes:
This has the effect of clearing the Snap's cache, so any node lifts performed after the `$lib.time.sleep(...)` executes will be lifted directly from storage.

Args:
valu (int): The number of seconds to pause for.

Returns:
The return type is `null`.

$lib.time.ticker(tick, count=$lib.null)

Periodically pause the processing of data in the storm query.

Notes:
This has the effect of clearing the Snap's cache, so any node lifts performed after each tick will be lifted directly from storage.

Args:
tick (int): The amount of time to wait between each tick, in seconds.

count (int): The number of times to pause the query before exiting the loop. This defaults to None and will yield forever if not set.

Yields:
This yields the current tick count after each time it wakes up. The return type is `int`.

$lib.time.toUTC(tick, timezone)

Adjust an epoch milliseconds timestamp to UTC from the given timezone.

Args:
tick (time): A time value.

timezone (str): A timezone name. See python pytz docs for options.

Returns:
An ($ok, $valu) tuple. The return type is *list*.

$lib.time.year(tick)

Returns the year part of a time value.

Args:
tick (time): A time value.

Returns:
The year part of the time expression. The return type is `int`.

13.1.78 $lib.trigger

A Storm Library for interacting with Triggers in the Cortex.

$lib.trigger.add(tdef)

Add a Trigger to the Cortex.

Args:
tdef (dict): A Trigger definition.

Returns:
The new trigger. The return type is *trigger*.

$lib.trigger.del(prefix)

Delete a Trigger from the Cortex.

Args:
prefix (str): A prefix to match in order to identify a trigger to delete. Only a single matching prefix will be deleted.

Returns:
The iden of the deleted trigger which matched the prefix. The return type is *str*.

$lib.trigger.disable(prefix)

Disable a Trigger in the Cortex.

Args:
prefix (str): A prefix to match in order to identify a trigger to disable. Only a single matching prefix will be disabled.

Returns:
The iden of the trigger that was disabled. The return type is *str*.

$lib.trigger.enable(prefix)

Enable a Trigger in the Cortex.

Args:
prefix (str): A prefix to match in order to identify a trigger to enable. Only a single matching prefix will be enabled.

Returns:
The iden of the trigger that was enabled. The return type is *str*.

$lib.trigger.get(iden)

Get a Trigger in the Cortex.

Args:
iden (str): The iden of the Trigger to get.

Returns:
The requested `trigger` object. The return type is *trigger*.

$lib.trigger.list(all=$lib.false)

Get a list of Triggers in the current view or every view.

Args:
all (boolean): Get a list of all the readable Triggers in every readable View.

Returns:
A list of `trigger` objects the user is allowed to access. The return type is *list*.

$lib.trigger.mod(prefix, query)

Modify an existing Trigger in the Cortex.

Args:
prefix (str): A prefix to match in order to identify a trigger to modify. Only a single matching prefix will be modified.

query: The new Storm query to set as the trigger query. The input type may be one of the following: `str`, `storm:query`.

Returns:
The iden of the modified Trigger The return type is *str*.

13.1.79 $lib.user

A Storm Library for interacting with data about the current user.

$lib.user.allowed(permname, gateiden=$lib.null, default=$lib.false)

Check if the current user has a given permission.

Args:
permname (str): The permission string to check.

gateiden (str): The authgate iden.

default (boolean): The default value.

Returns:
True if the user has the requested permission, false otherwise. The return type is *boolean*.

$lib.user.iden

The user GUID for the current storm user.

Returns:
The type is *str*.

$lib.user.name()

Get the name of the current runtime user.

Returns:
The username. The return type is *str*.

$lib.user.profile

Get a Hive dictionary representing the current user's profile information.

Returns:
The type is *hive:dict*.

$lib.user.vars

Get a Hive dictionary representing the current user's persistent variables.

Returns:
The type is *hive:dict*.

13.1.80 $lib.vars

A Storm Library for interacting with runtime variables.

$lib.vars.del(name)

Unset a variable in the current Runtime.

Args:
name (str): The variable name to remove.

Returns:
The return type is `null`.

$lib.vars.get(name, defv=$lib.null)

Get the value of a variable from the current Runtime.

Args:
name (str): Name of the variable to get.

defv (prim): The default value returned if the variable is not set in the runtime.

Returns:
The value of the variable. The return type is `any`.

$lib.vars.list()

Get a list of variables from the current Runtime.

Returns:
A list of variable names and their values for the current Runtime. The return type is *list*.

$lib.vars.set(name, valu)

Set the value of a variable in the current Runtime.

Args:
name (str): Name of the variable to set.

valu (prim): The value to set the variable too.

Returns:
The return type is `null`.

$lib.vars.type(valu)

Get the type of the argument value.

Args:
valu (any): Value to inspect.

Returns:
The type of the argument. The return type is *str*.

13.1.81 $lib.vault

A Storm Library for interacting with vaults.

$lib.vault.add(name, vtype, scope, owner, secrets, configs)

Create a new vault.

Args:
name (str): The name of the new vault.

vtype (str): The type of this vault.

scope (str): Scope for this vault. One of "user", "role", "global", or $lib.null for unscoped vaults.

owner (str): User/role iden for this vault if scope is "user" or "role". None for "global" scope vaults.

secrets (dict): The initial secret data to store in this vault.

configs (dict): The initial config data to store in this vault.

Returns:
Iden of the newly created vault. The return type is *str*.

$lib.vault.byname(name)

Get a vault by name.

Args:

name (str):
The name of the vault to retrieve. If user only has PERM_READ, the secrets data will not be returned. If the user has PERM_EDIT or higher, secrets data will be included in the vault.

Returns:
The requested vault. The return type is *dict*.

$lib.vault.bytype(vtype, scope=$lib.null)

Get a vault for a specified vault type.

Args:
vtype (str): The vault type to retrieved.

scope (str): The scope for the specified type. If $lib.null, then getByType will search.

Returns:
Vault or $lib.null if the vault could not be retrieved. The return type is *vault*.

$lib.vault.get(iden)

Get a vault by iden.

Args:

iden (str):
The iden of the vault to retrieve. If user only has PERM_READ, the secrets data will not be returned. If the user has PERM_EDIT or higher, secrets data will be included in the vault.

Returns:
The requested vault. The return type is *dict*.

$lib.vault.list()

List vaults accessible to the current user.

Returns:
Yields vaults. The return type is *list*.

$lib.vault.print(vault)

Print the details of the specified vault.

Args:
vault (dict): The vault to print.

Returns:
The return type is `null`.

13.1.82 $lib.version

A Storm Library for interacting with version information.

$lib.version.commit()

The synapse commit hash for the local Cortex.

Returns:
The commit hash. The return type is *str*.

$lib.version.matches(vertup, reqstr)

Check if the given version triple meets the requirements string.

Examples:
Check if the synapse version is in a range:

```
$synver = $lib.version.synapse()
if $lib.version.matches($synver, ">=2.9.0") {
    $dostuff()
}
```

Args:
vertup (list): Triple of major, minor, and patch version integers.

reqstr (str): The version string to compare against.

Returns:
True if the version meets the requirements, False otherwise. The return type is *boolean*.

$lib.version.synapse()

The synapse version tuple for the local Cortex.

Returns:
The version triple. The return type is *list*.

13.1.83 $lib.view

A Storm Library for interacting with Views in the Cortex.

$lib.view.add(layers, name=$lib.null, worldreadable=$lib.false)

Add a View to the Cortex.

Args:
layers (list): A list of layer idens which make up the view.

name (str): The name of the view.

worldreadable (boolean): Grant read access to the *all* role.

Returns:
A `view` object representing the new View. The return type is *view*.

$lib.view.del(iden)

Delete a View from the Cortex.

Args:
iden (str): The iden of the View to delete.

Returns:
The return type is `null`.

$lib.view.get(iden=$lib.null)

Get a View from the Cortex.

Args:
iden (str): The iden of the View to get. If not specified, returns the current View.

Returns:
The storm view object. The return type is *view*.

$lib.view.list(deporder=$lib.false)

List the Views in the Cortex.

Args:
deporder (bool): Return the lists in bottom-up dependency order.

Returns:
List of `view` objects. The return type is *list*.

13.1.84 $lib.xml

A Storm library for parsing XML.

$lib.xml.parse(valu)

Parse an XML string into an xml:element tree.

Args:
valu (str): The XML string to parse into an xml:element tree.

Returns:
An xml:element for the root node of the XML tree. The return type is *xml:element*.

13.1.85 $lib.yaml

A Storm Library for saving/loading YAML data.

$lib.yaml.load(valu)

Decode a YAML string/bytes into an object.

Args:
valu (str): The string to decode.

Returns:
The decoded primitive object. The return type is `prim`.

$lib.yaml.save(valu, sort_keys=$lib.true)

Encode data as a YAML string.

Args:
valu (object): The object to encode.

sort_keys (boolean): Sort object keys.

Returns:
A YAML string. The return type is *str*.

13.2 Storm Types

Storm Objects are used as view objects for manipulating data in the Storm Runtime and in the Cortex itself.

13.2.1 aha:pool

Implements the Storm API for an AHA pool.

add(svcname)

Add a service to the AHA pool

Examples:
Add a service to a pool with its relative name:

```
$pool = $lib.aha.pool.get(pool00.cortex...)
$pool.add(00.cortex...)
```

Args:
svcname (str): The name of the AHA service to add. It is easiest to use the relative name of a service, ending with "…".

Returns:
The return type is `null`.

add(svcname)

Remove a service from the AHA pool.

Examples:
Remove a service from a pool with its relative name:

```
$pool = $lib.aha.pool.get(pool00.cortex...)
$pool.del(00.cortex...)
```

Args:
svcname (str): The name of the AHA service to remove. It is easiest to use the relative name of a service, ending with "...".

Returns:
The return type is `null`.

13.2.2 auth:gate

Implements the Storm API for an AuthGate.

iden

The iden of the AuthGate.

Returns:
The type is *str*.

roles

The role idens which are a member of the Authgate.

Returns:
The type is *list*.

type

The type of the AuthGate.

Returns:
The type is *str*.

users

The user idens which are a member of the Authgate.

Returns:
The type is *list*.

13.2.3 auth:role

Implements the Storm API for a Role.

addRule(rule, gateiden=$lib.null, indx=$lib.null)

Add a rule to the Role

Args:
rule (list): The rule tuple to added to the Role.

gateiden (str): The gate iden used for the rule.

indx (int): The position of the rule as a 0 based index.

Returns:
The return type is `null`.

delRule(rule, gateiden=$lib.null)

Remove a rule from the Role.

Args:
rule (list): The rule tuple to removed from the Role.

gateiden (str): The gate iden used for the rule.

Returns:
The return type is `null`.

gates()

Return a list of auth gates that the role has rules for.

Returns:
A list of `auth:gates` that the role has rules for. The return type is *list*.

get(name)

Get a arbitrary property from the Role definition.

Args:
name (str): The name of the property to return.

Returns:
The requested value. The return type is `prim`.

getRules(gateiden=$lib.null)

Get the rules for the role and optional auth gate.

Args:
  gateiden (str): The gate iden used for the rules.

Returns:
  A list of rules. The return type is *list*.

iden

The Role iden.

Returns:
  The type is *str*.

name

A role's name. This can also be used to set the role name.

Example:
  Change a role's name:

```
$role=$lib.auth.roles.byname(analyst) $role.name=superheroes
```

Returns:
  The return type is *str*. When this is used to set the value, it does not have a return type.

pack()

Get the packed version of the Role.

Returns:
  The packed Role definition. The return type is *dict*.

popRule(indx, gateiden=$lib.null)

Remove a rule by index from the Role.

Args:
  indx (int): The index of the rule to remove.

  gateiden (str): The gate iden used for the rule.

Returns:
  The rule which was removed. The return type is *list*.

setRules(rules, gateiden=$lib.null)

Replace the rules on the Role with new rules.

Args:
: rules (list): A list of rules to set on the Role.

  gateiden (str): The gate iden used for the rules.

Returns:
: The return type is `null`.

13.2.4 auth:user

Implements the Storm API for a User.

addRule(rule, gateiden=$lib.null, indx=$lib.null)

Add a rule to the User.

Args:
: rule (list): The rule tuple to add to the User.

  gateiden (str): The gate iden used for the rule.

  indx (int): The position of the rule as a 0 based index.

Returns:
: The return type is `null`.

allowed(permname, gateiden=$lib.null, default=$lib.false)

Check if the user has a given permission.

Args:
: permname (str): The permission string to check.

  gateiden (str): The authgate iden.

  default (boolean): The default value.

Returns:
: True if the rule is allowed, False otherwise. The return type is *boolean*.

delApiKey(iden)

Delete an existing API key.

Args:
: iden (str): The iden of the API key.

Returns:
: True when the key was deleted. The return type is *boolean*.

delRule(rule, gateiden=$lib.null)

Remove a rule from the User.

Args:
rule (list): The rule tuple to removed from the User.

gateiden (str): The gate iden used for the rule.

Returns:
The return type is `null`.

email

A user's email. This can also be used to set the user's email.

Example:
Change a user's email address:

```
$user=$lib.auth.users.byname(bob) $user.email="robert@bobcorp.net"
```

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

gates()

Return a list of auth gates that the user has rules for.

Returns:
A list of `auth:gates` that the user has rules for. The return type is *list*.

genApiKey(name, duration=$lib.null)

Generate a new API key for the user.

Notes:
The secret API key returned by this function cannot be accessed again.

Args:
name (str): The name of the API key.

duration (integer): Duration of time for the API key to be valid, in milliseconds.

Returns:
A list, containing the secret API key and a dictionary containing metadata about the key. The return type is *list*.

get(name)

Get a arbitrary property from the User definition.

Args:
name (str): The name of the property to return.

Returns:
The requested value. The return type is `prim`.

getAllowedReason(permname, gateiden=$lib.null, default=$lib.false)

Return an allowed status and reason for the given perm.

Args:
permname (str): The permission string to check.

gateiden (str): The authgate iden.

default (boolean): The default value.

Returns:
An (allowed, reason) tuple. The return type is *list*.

getApiKey(iden)

Get information about a user's existing API key.

Args:
iden (str): The iden of the API key.

Returns:
A dictionary containing metadata about the key. The return type is *dict*.

getRules(gateiden=$lib.null)

Get the rules for the user and optional auth gate.

Args:
gateiden (str): The gate iden used for the rules.

Returns:
A list of rules. The return type is *list*.

grant(iden, indx=$lib.null)

Grant a Role to the User.

Args:
iden (str): The iden of the Role.

indx (int): The position of the Role as a 0 based index.

Returns:
The return type is `null`.

iden

The User iden.

Returns:
The type is *str*.

listApiKeys()

Get information about all the API keys the user has.

Returns:
A list of dictionaries containing metadata about each key. The return type is *list*.

modApiKey(iden, name, valu)

Modify metadata about an existing API key.

Args:
iden (str): The iden of the API key.

name (str): The name of the valu to update.

valu (any): The new value of the API key.

Returns:
An updated dictionary with metadata about the key. The return type is *dict*.

name

A user's name. This can also be used to set a user's name.

Example:
Change a user's name:

```
$user=$lib.auth.users.byname(bob) $user.name=robert
```

Returns:
The return type is *str*. When this is used to set the value, it does not have a return type.

notify(mesgtype, mesgdata)

Send an arbitrary user notification.

Args:
mesgtype (str): The notification type.

mesgdata (dict): The notification data.

Returns:
The return type is `null`.

pack()

Get the packed version of the User.

Returns:
The packed User definition. The return type is *dict*.

popRule(indx, gateiden=$lib.null)

Remove a rule by index from the User.

Args:
indx (int): The index of the rule to remove.

gateiden (str): The gate iden used for the rule.

Returns:
The rule which was removed. The return type is *list*.

profile

A user profile dictionary. This can be used as an application level key-value store.

Example:
Set a value:

```
$user=$lib.auth.users.byname(bob) $user.profile.somekey="somevalue"
```

Get a value:

```
$user=$lib.auth.users.byname(bob) $value = $user.profile.somekey
```

Returns:
The return type is *auth:user:profile*.

revoke(iden)

Remove a Role from the User

Args:
iden (str): The iden of the Role.

Returns:
The return type is `null`.

roles()

Get the Roles for the User.

Returns:
A list of `auth:roles` which the user is a member of. The return type is *list*.

setAdmin(admin, gateiden=$lib.null)

Set the Admin flag for the user.

Args:
admin (boolean): True to make the User an admin, false to remove their admin status.

gateiden (str): The gate iden used for the operation.

Returns:
The return type is `null`.

setEmail(email)

Set the email address of the User.

Args:
email (str): The email address to set for the User.

Returns:
The return type is `null`.

setLocked(locked)

Set the locked status for a user.

Args:
locked (boolean): True to lock the user, false to unlock them.

Returns:
The return type is `null`.

setPasswd(passwd)

Set the Users password.

Args:
passwd (str): The new password for the user. This is best passed into the runtime as a variable.

Returns:
The return type is `null`.

setRoles(idens)

Replace all the Roles of the User with a new list of roles.

Notes:
The roleiden for the "all" role must be present in the new list of roles. This replaces all existing roles that the user has with the new roles.

Args:
idens (list): The idens to of the Role.

Returns:
The return type is `null`.

setRules(rules, gateiden=$lib.null)

Replace the rules on the User with new rules.

Args:
rules (list): A list of rule tuples.

gateiden (str): The gate iden used for the rules.

Returns:
The return type is `null`.

tell(text)

Send a tell notification to a user.

Args:
text (str): The text of the message to send.

Returns:
The return type is `null`.

vars

Get a dictionary representing the user's persistent variables.

Returns:
The return type is *auth:user:vars*.

13.2.5 auth:user:json

Implements per-user JSON storage.

del(path, prop=$lib.null)

Delete a stored JSON object or object property for the user.

Args:
path (str|list): A path string or list of path parts.

prop (str|list): A property name or list of name parts.

Returns:
True if the del operation was successful. The return type is *boolean*.

get(path, prop=$lib.null)

Return a stored JSON object or object property for the user.

Args:
path (str|list): A path string or list of path parts.

prop (str|list): A property name or list of name parts.

Returns:
The previously stored value or $lib.null The return type is `prim`.

iter(path=$lib.null)

Yield (<path>, <valu>) tuples for the users JSON objects.

Args:
path (str|list): A path string or list of path parts.

Yields:
(<path>, <item>) tuples. The return type is *list*.

set(path, valu, prop=$lib.null)

Set a JSON object or object property for the user.

Args:
path (str|list): A path string or list of path elements.

valu (prim): The value to set as the JSON object or object property.

prop (str|list): A property name or list of name parts.

Returns:
True if the set operation was successful. The return type is *boolean*.

13.2.6 auth:user:profile

The Storm deref/setitem/iter convention on top of User profile information.

13.2.7 auth:user:vars

The Storm deref/setitem/iter convention on top of User vars information.

13.2.8 boolean

Implements the Storm API for a boolean instance.

13.2.9 bytes

Implements the Storm API for a Bytes object.

bunzip()

Decompress the bytes using bzip2.

Example:
Decompress bytes with bzip2:

```
$foo = $mybytez.bunzip()
```

Returns:
Decompressed bytes. The return type is *bytes*.

bzip()

Compress the bytes using bzip2 and return them.

Example:
Compress bytes with bzip:

```
$foo = $mybytez.bzip()
```

Returns:
The bzip2 compressed bytes. The return type is *bytes*.

decode(encoding=utf8, errors=surrogatepass)

Decode bytes to a string.

Args:
encoding (str): The encoding to use.

errors (str): The error handling scheme to use.

Returns:
The decoded string. The return type is *str*.

gunzip()

Decompress the bytes using gzip and return them.

Example:
Decompress bytes with bzip2:

```
$foo = $mybytez.gunzip()
```

Returns:
Decompressed bytes. The return type is *bytes*.

gzip()

Compress the bytes using gzip and return them.

Example:
Compress bytes with gzip:

```
$foo = $mybytez.gzip()
```

Returns:
The gzip compressed bytes. The return type is *bytes*.

json(encoding=$lib.null, errors=surrogatepass)

Load JSON data from bytes.

Notes:
The bytes must be UTF8, UTF16 or UTF32 encoded.

Example:
Load bytes to a object:

```
$foo = $mybytez.json()
```

Args:
encoding (str): Specify an encoding to use.

errors (str): Specify an error handling scheme to use.

Returns:
The deserialized object. The return type is `prim`.

slice(start, end=$lib.null)

Slice a subset of bytes from an existing bytes.

Examples:
Slice from index to 1 to 5:

```
$subbyts = $byts.slice(1,5)
```

Slice from index 3 to the end of the bytes:

```
$subbyts = $byts.slice(3)
```

Args:
start (int): The starting byte index.

end (int): The ending byte index. If not specified, slice to the end.

Returns:
The slice of bytes. The return type is *bytes*.

unpack(fmt, offset=(0))

Unpack structures from bytes using python struct.unpack syntax.

Examples:
Unpack 3 unsigned 16 bit integers in little endian format:

```
($x, $y, $z) = $byts.unpack("<HHH")
```

Args:
fmt (str): A python struck.pack format string.

offset (int): An offset to begin unpacking from.

Returns:
The unpacked primitive values. The return type is *list*.

13.2.10 cache:fixed

A StormLib API instance of a Storm Fixed Cache.

clear()

Clear all items from the cache.

Returns:
The return type is `null`.

get(key)

Get an item from the cache by key.

Args:
key (any): The key to lookup.

Returns:
The value from the cache, or the callback query if it does not exist The return type is `any`.

pop(key)

Pop an item from the cache.

Args:
key (any): The key to pop.

Returns:
The value from the cache, or $lib.null if it does not exist The return type is `any`.

put(key, value)

Put an item into the cache.

Args:
key (any): The key put in the cache.

value (any): The value to assign to the key.

Returns:
The return type is `null`.

query

Get the callback Storm query as string.

Returns:
The callback Storm query text. The return type is *str*.

13.2.11 cmdopts

A dictionary like object that holds a reference to a command options namespace. (This allows late-evaluation of command arguments rather than forcing capture)

13.2.12 cronjob

Implements the Storm api for a cronjob instance.

iden

The iden of the Cron Job.

Returns:
The type is *str*.

pack()

Get the Cronjob definition.

Returns:
The definition. The return type is *dict*.

pprint()

Get a dictionary containing user friendly strings for printing the CronJob.

Returns:
A dictionary containing structured data about a cronjob for display purposes. The return type is *dict*.

set(name, valu)

Set an editable field in the cron job definition.

Example:
Change the name of a cron job:

```
$lib.cron.get($iden).set(name, "foo bar cron job")
```

Args:
name (str): The name of the field being set

valu (any): The value to set on the definition.

Returns:
The `cronjob` The return type is *cronjob*.

13.2.13 dict

Implements the Storm API for a Dictionary object.

13.2.14 hive:dict

A Storm Primitive representing a HiveDict.

get(name, default=$lib.null)

Get the named value from the HiveDict.

Args:
name (str): The name of the value.

default (prim): The default value to return if the name is not set.

Returns:
The requested value. The return type is `prim`.

list()

List the keys and values in the HiveDict.

Returns:
A list of tuples containing key, value pairs. The return type is *list*.

pop(name, default=$lib.null)

Remove a value out of the HiveDict.

Args:
name (str): The name of the value.

default (prim): The default value to return if the name is not set.

Returns:
The requested value. The return type is `prim`.

set(name, valu)

Set a value in the HiveDict.

Args:
name (str): The name of the value to set

valu (prim): The value to store in the HiveDict

Returns:
Old value of the dictionary if the value was previously set, or none. The return type may be one of the following: `null`, `prim`.

13.2.15 http:api

Extended HTTP API object.

This object represents an extended HTTP API that has been configured on the Cortex.

authenticated

Boolean value indicating if the Extended HTTP API requires an authenticated user or session.

Returns:
The return type is *boolean*. When this is used to set the value, it does not have a return type.

created

The time the Extended HTTP API was created.

Returns:
The type is `int`.

creator

The user that created the Extended HTTP API.

Returns:
The return type is *auth:user*.

desc

The description of the API instance.

Returns:
The return type is *str*. When this is used to set the value, it does not have a return type.

iden

The iden of the Extended HTTP API.

Returns:
The type is *str*.

methods

The dictionary containing the Storm code used to implement the HTTP methods.

Returns:
The return type is *http:api:methods*.

name

The name of the API instance.

Returns:
The return type is *str*. When this is used to set the value, it does not have a return type.

owner

The user that runs the endpoint query logic when runas="owner".

Returns:
The return type is *auth:user*. When this is used to set the value, it does not have a return type.

pack()

Get a packed copy of the HTTP API object.

Returns:
The return type is *dict*.

path

The path of the API instance.

This path may contain regular expression capture groups, which are used to populate request arguments.

Note:
The Cortex does not inspect paths in order to identify duplicates or overlapping paths. It is the responsibility of the Cortex administrator to configure their Extended HTTP API paths so that they are correct for their use cases.

Example:
Update an API path to contain a single wildcard argument:

```
$api.path = 'foo/bar/(.*)/baz'
```

Update an API path to contain a two wildcard arguments with restricted character sets:

```
$api.path = 'hehe/([a-z]*)/([0-9]{1-4})'
```

Returns:
The return type is *str*. When this is used to set the value, it does not have a return type.

perms

The permissions an authenticated user must have in order to access the HTTP API.

Returns:
The return type is *http:api:perms*. When this is used to set the value, it does not have a return type.

pool

Boolean value indicating if the handler responses may be executed as part of a Storm pool.

Returns:
The return type is *boolean*. When this is used to set the value, it does not have a return type.

readonly

Boolean value indicating if the Storm methods are executed in a readonly Storm runtime.

Returns:
The return type is *boolean*. When this is used to set the value, it does not have a return type.

runas

String indicating whether the requests run as the owner or the authenticated user.

Returns:
The return type is *str*. When this is used to set the value, it does not have a return type.

updated

The time the Extended HTTP API was last modified.

Returns:
The return type is `int`.

vars

The Storm runtime variables specific for the API instance.

Returns:
The return type is *http:api:vars*. When this is used to set the value, it does not have a return type.

view

The View of the API instance. This is the view that Storm methods are executed in.

Returns:
The return type is *view*. When this is used to set the value, it does not have a return type.

13.2.16 http:api:methods

Accessor dictionary for getting and setting Extended HTTP API methods.

Notes:
The Storm code used to run these methods will have a $request object injected into them. This allows the method to send data back to the caller when it is run.

Examples:
Setting a simple GET method:

```
$api.methods.get = ${
    $data = ({"someKey": "someValue})
    $headers = ({"someHeader": "someOtherValue"})
    $request.reply(200, headers=$headers, body=$data)
}
```

Removing a PUT method:

```
$api.methods.put = $lib.undef
```

Crafting a custom text response:

```
$api.methods.get = ${
    // Create the body
    $data = 'some value'
    // Encode the response as bytes
    $data = $data.encode()
    // Set the headers
    $headers = ({"Content-Type": "text/plain", "Content-Length": $lib.len($data})
    $request.reply(200, headers=$headers, body=$data)
}
```

Streaming multiple chunks of data as JSON lines. This sends the code, headers and body separately:

```
$api.methods.get = ${
    $request.sendcode(200)
    $request.sendheaders(({"Content-Type": "text/plain; charset=utf8"}))
    $values = ((1), (2), (3))
    for $i in $values {
        $body=`{$lib.json.save(({"value": $i}))}

        $request.sendbody($body.encode())
    }
}
```

delete

The DELETE request Storm code.

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

get

The GET request Storm code.

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

head

The HEAD request Storm code

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

options

The OPTIONS request Storm code.

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

patch

The PATCH request Storm code.

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

post

The POST request Storm code.

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

put

The PUT request Storm code.

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

13.2.17 http:api:perms

Accessor list for getting and setting http:api permissions.

append(valu)

Append a permission to the list.

Args:
valu (any): The permission to append to the list.

Returns:
The return type is `null`.

extend(valu)

Extend a list using another iterable.

Args:
valu (list): A list or other iterable.

Returns:
The return type is `null`.

has(valu)

Check it a permission is in the list.

Args:
valu (any): The permission to check.

Returns:
True if the permission is in the list, false otherwise. The return type is *boolean*.

index(valu)

Return a single permission from the list by index.

Args:
valu (int): The list index value.

Returns:
The permission present in the list at the index position. The return type is `any`.

length()

Get the length of the list. This is deprecated; please use `.size()` instead.

Returns:
The size of the list. The return type is `int`.

pop()

Pop and return the last permission in the list.

Returns:
The last permission from the list. The return type is `any`.

reverse()

Reverse the order of the list in place

Returns:
The return type is `null`.

size()

Return the length of the list.

Returns:
The size of the list. The return type is `int`.

slice(start, end=$lib.null)

Get a slice of the list.

Args:
start (int): The starting index.

end (int): The ending index. If not specified, slice to the end of the list.

Returns:
The slice of the list. The return type is *list*.

13.2.18 http:api:request

Extended HTTP API Request object.

api

The http:api object for the request.

Returns:
The return type is *http:api*.

args

A list of path arguments made as part of the HTTP API request. These are the results of any capture groups defined in the Extended HTTP API path regular expression.

Returns:
The type is *list*.

body

The raw request body.

Returns:
The type is *bytes*.

client

The remote IP of the requester.

Returns:
The type is *str*.

headers

The request headers.

Returns:
The return type is *http:api:request:headers*.

json

The request body as json.

Returns:
The return type is *dict*.

method

The request method

Returns:
The type is *str*.

params

Request parameters.

Returns:
The type is *dict*.

path

The path which was matched against the Extended HTTPAPI endpoint.

Returns:
The type is *str*.

reply(code, headers=$lib.null, body=$lib.undef)

Convenience method to send the response code, headers and body together.

Notes:
This can only be called once.

If the response body is not bytes, this method will serialize the body as JSON and set the `Content-Type` and `Content-Length` response headers.

Args:
code (int): The response code.

headers (dict): The response headers.

body (any): The response body.

Returns:
The return type is `null`.

sendbody(body)

Send the HTTP response body.

Args:
body (bytes): The response body.

Returns:
The return type is `null`.

sendcode(code)

Send the HTTP response code.

Args:
code (int): The response code.

Returns:
The return type is `null`.

sendheaders(headers)

Send the HTTP response headers.

Args:
headers (dict): The response headers.

Returns:
The return type is `null`.

uri

The full request URI.

Returns:
The type is *str*.

user

The user iden who made the HTTP API request.

Returns:
The type is *str*.

13.2.19 http:api:request:headers

Immutable lowercase key access dictionary for HTTP request headers.

Example:
Request headers can be accessed in a case insensitive manner:

```
$valu = $request.headers.Cookie
// or the lower case value
$valu = $request.headers.cookie
```

13.2.20 http:api:vars

Accessor dictionary for getting and setting Extended HTTP API variables.

This can be used to set, unset or iterate over the runtime variables that are set for an Extended HTTP API endpoint. These variables are set in the Storm runtime for all of the HTTP methods configured to be executed by the endpoint.

Example:
Set a few variables on a given API:

```
$api.vars.foo = 'the foo string'
$api.vars.bar = (1234)
```

Remove a variable:

```
$api.vars.foo = $lib.undef
```

Iterate over the variables set for the endpoint:

```
for ($key, $valu) in $api.vars {
    $lib.print(`{$key) -> {$valu}`)
}
```

Overwrite all of the variables for a given API with a new dictionary:

```
$api.vars = ({"foo": "a new string", "bar": (137)})
```

13.2.21 inet:http:oauth:v1:client

A client for doing OAuth V1 Authentication from Storm.

sign(baseurl, method=GET, headers=$lib.null, params=$lib.null, body=$lib.null)

Sign an OAuth request to a particular URL.

Args:

baseurl (str): The base url to sign and query.

method (dict): The HTTP Method to use as part of signing.

headers (dict): Optional headers used for signing. Can override the "Content-Type" header if the signature type is set to SIG_BODY

params (dict): Optional query parameters to pass to url construction and/or signing.

body (bytes): Optional HTTP body to pass to request signing.

Returns:

A 3-element tuple of ($url, $headers, $body). The OAuth signature elements will be embedded in the element specified when constructing the client. The return type is *list*.

13.2.22 inet:http:resp

Implements the Storm API for a HTTP response.

body

The raw HTTP response body as bytes.

Returns:

The type is *bytes*.

code

The HTTP status code. It is -1 if an exception occurred.

Returns:

The type is `int`.

err

Tuple of the error type and information if an exception occurred.

Returns:
The type is *list*.

headers

The HTTP Response headers.

Returns:
The type is *dict*.

json(encoding=$lib.null, errors=surrogatepass)

Get the JSON deserialized response.

Args:
encoding (str): Specify an encoding to use.

errors (str): Specify an error handling scheme to use.

Returns:
The return type is `prim`.

msgpack()

Yield the msgpack deserialized objects.

Yields:
Unpacked values. The return type is `prim`.

reason

The reason phrase for the HTTP status code.

Returns:
The type is *str*.

13.2.23 inet:http:socket

Implements the Storm API for a Websocket.

rx(timeout=$lib.null)

Receive a message from the web socket.

Args:
timeout (int): The timeout to wait for

Returns:
An ($ok, $valu) tuple. The return type is *list*.

tx(mesg)

Transmit a message over the web socket.

Args:
mesg (dict): A JSON compatible message.

Returns:
An ($ok, $valu) tuple. The return type is *list*.

13.2.24 inet:imap:server

An IMAP server for retrieving email messages.

delete(uid_set)

Mark an RFC2060 UID message as deleted and expunge the mailbox.

The command uses the +FLAGS.SILENT command and applies the Deleted flag. The actual behavior of these commands are mailbox configuration dependent.

Examples:
Mark a single message as deleted and expunge:

```
($ok, $valu) = $server.delete("8182")
```

Mark ranges of messages as deleted and expunge:

```
($ok, $valu) = $server.delete("1:3,6:9")
```

Args:
uid_set (str): The UID message set to apply the flag to.

Returns:
An ($ok, $valu) tuple. The return type is *list*.

fetch(uid)

Fetch a message by UID in RFC822 format.

The message is saved to the Axon, and a `file:bytes` node is returned.

Examples:
Fetch a message, save to the Axon, and yield `file:bytes` node:

```
yield $server.fetch("8182")
```

Args:
uid (str): The single message UID.

Returns:
The file:bytes node representing the message. The return type is *node*.

list(reference_name="", pattern=*)

List mailbox names.

By default this method uses a reference_name and pattern to return all mailboxes from the root.

Args:
reference_name (str): The mailbox reference name.

pattern (str): The pattern to filter by.

Returns:
An ($ok, $valu) tuple where $valu is a list of names if $ok=True. The return type is *list*.

login(user, passwd)

Login to the IMAP server.

Args:
user (str): The username to login with.

passwd (str): The password to login with.

Returns:
An ($ok, $valu) tuple. The return type is *list*.

markSeen(uid_set)

Mark messages as seen by an RFC2060 UID message set.

The command uses the +FLAGS.SILENT command and applies the Seen flag.

Examples:
Mark a single messsage as seen:

```
($ok, $valu) = $server.markSeen("8182")
```

Mark ranges of messages as seen:

```
($ok, $valu) = $server.markSeen("1:3,6:9")
```

Args:
uid_set (str): The UID message set to apply the flag to.

Returns:
An ($ok, $valu) tuple. The return type is *list*.

search(*args, charset=utf-8)

Search for messages using RFC2060 syntax.

Examples:
Retrieve all messages:

```
($ok, $uids) = $server.search("ALL")
```

Search by FROM and SINCE:

```
($ok, $uids) = $server.search("FROM", "visi@vertex.link", "SINCE", "01-Oct-2021")
```

Search by a subject substring:

```
($ok, $uids) = $search.search("HEADER", "Subject", "An email subject")
```

Args:
*args (str): A set of search criteria to use.

charset: The CHARSET used for the search. May be set to $lib.null to disable CHARSET. The input type may be one of the following: `str`, `null`.

Returns:
An ($ok, $valu) tuple, where $valu is a list of UIDs if $ok=True. The return type is *list*.

select(mailbox=INBOX)

Select a mailbox to use in subsequent commands.

Args:
mailbox (str): The mailbox name to select.

Returns:
An ($ok, $valu) tuple. The return type is *list*.

13.2.25 inet:smtp:message

An SMTP message to compose and send.

headers

A dictionary of email header values.

Returns:
The type is *dict*.

html

The HTML body of the email message. This can also be used to set an HTML body in the message.

Returns:
The return type is *str*. When this is used to set the value, it does not have a return type.

recipients

An array of RCPT TO email addresses.

Returns:
The type is *list*.

send(host, port=(25), user=$lib.null, passwd=$lib.null, usetls=$lib.false, starttls=$lib.false, timeout=(60))

Transmit a message over the web socket.

Args:
host (str): The hostname or IP address of the SMTP server.

port (int): The port that the SMTP server is listening on.

user (str): The user name to use authenticating to the SMTP server.

passwd (str): The password to use authenticating to the SMTP server.

usetls (bool): Initiate a TLS connection to the SMTP server.

starttls (bool): Use the STARTTLS directive with the SMTP server.

timeout (int): The timeout (in seconds) to wait for message delivery.

Returns:
An ($ok, $valu) tuple. The return type is *list*.

sender

The inet:email to use in the MAIL FROM request. This can also be used to set the sender for the message.

Returns:
The return type is *str*. When this is used to set the value, it does not have a return type.

text

The text body of the email message. This can also be used to set the body of the message.

Returns:
The return type is *str*. When this is used to set the value, it does not have a return type.

13.2.26 json:schema

A JsonSchema validation object for use in validating data structures in Storm.

schema()

The schema belonging to this object.

Returns:
A copy of the schema used for this object. The return type is *dict*.

validate(item)

Validate a structure against the Json Schema

Args:
item (prim): A JSON structure to validate (dict, list, etc...)

Returns:
An ($ok, $valu) tuple. If $ok is True, then $valu should be used as the validated data structure. If $ok is False, $valu is a dictionary with a "mesg" key. The return type is *list*.

13.2.27 layer

Implements the Storm api for a layer instance.

addPull(url, offs=(0), queue_size=(10000), chunk_size=(1000))

Configure the layer to pull edits from a remote layer/feed.

Args:
url (str): The telepath URL to a layer/feed.

offs (int): The offset to begin from.

queue_size (int): The queue size of the puller.

chunk_size (int): The chunk size of the puller when consuming edits.

Returns:
Dictionary containing the pull definition. The return type is *dict*.

addPush(url, offs=(0), queue_size=(10000), chunk_size=(1000))

Configure the layer to push edits to a remote layer/feed.

Args:
url (str): A telepath URL of the target layer/feed.

offs (int): The local layer offset to begin pushing from

queue_size (int): The queue size of the pusher.

chunk_size (int): The chunk size of the pusher when pushing edits.

Returns:
Dictionary containing the push definition. The return type is *dict*.

delPull(iden)

Remove a pull config from the layer.

Args:
iden (str): The iden of the push config to remove.

Returns:
The return type is `null`.

delPush(iden)

Remove a push config from the layer.

Args:
iden (str): The iden of the push config to remove.

Returns:
The return type is `null`.

edits(offs=(0), wait=$lib.true, size=$lib.null)

Yield (offs, nodeedits) tuples from the given offset.

Args:
offs (int): Offset to start getting nodeedits from the layer at.

wait (boolean): If true, wait for new edits, otherwise exit the generator when there are no more edits.

size (int): The maximum number of nodeedits to yield.

Yields:
Yields offset, nodeedit tuples from a given offset. The return type is *list*.

get(name, defv=$lib.null)

Get a arbitrary value in the Layer definition.

Args:
name (str): Name of the value to get.

defv (prim): The default value returned if the name is not set in the Layer.

Returns:
The value requested or the default value. The return type is `prim`.

getEdges()

Yield (n1iden, verb, n2iden) tuples for any light edges in the layer.

Example:
Iterate the light edges in `$layer`:

```
for ($n1iden, $verb, $n2iden) in $layer.getEdges() {
    $lib.print(`{$n1iden} -({$verb})> {$n2iden}`)
}
```

Yields:
Yields (<n1iden>, <verb>, <n2iden>) tuples The return type is *list*.

getEdgesByN1(nodeid)

Yield (verb, n2iden) tuples for any light edges in the layer for the source node id.

Example:
Iterate the N1 edges for `$node`:

```
for ($verb, $n2iden) in $layer.getEdgesByN1($node.iden()) {
    $lib.print(`-({$verb})> {$n2iden}`)
}
```

Args:
nodeid (str): The hex string of the node id.

Yields:
Yields (<verb>, <n2iden>) tuples The return type is *list*.

getEdgesByN2(nodeid)

Yield (verb, n1iden) tuples for any light edges in the layer for the target node id.

Example:
Iterate the N2 edges for `$node`:

```
for ($verb, $n1iden) in $layer.getEdgesByN2($node.iden()) {
    $lib.print(`-({$verb})> {$n1iden}`)
}
```

Args:
nodeid (str): The hex string of the node id.

Yields:
Yields (<verb>, <n1iden>) tuples The return type is *list*.

getFormCounts()

Get the formcounts for the Layer.

Example:
Get the formcounts for the current Layer:

```
$counts = $lib.layer.get().getFormCounts()
```

Returns:
Dictionary containing form names and the count of the nodes in the Layer. The return type is *dict*.

getMirrorStatus()

Return a dictionary of the mirror synchronization status for the layer.

Returns:
An info dictionary describing mirror sync status. The return type is *dict*.

getPropArrayCount(propname, valu=$lib.undef)

Get the number of individual value rows in the layer for the given array property name.

Args:
propname (str): The property name to look up.

valu (any): A specific value in the array property to look up.

Returns:
The count of rows. The return type is `int`.

getPropCount(propname, maxsize=$lib.null, valu=$lib.undef)

Get the number of property rows in the layer for the given full form or property name.

Args:
propname (str): The property or form name to look up.

maxsize (int): The maximum number of rows to look up.

valu (any): A specific value of the property to look up.

Returns:
The count of rows. The return type is `int`.

getStorNode(nodeid)

Retrieve the raw storage node for the specified node id.

Args:
nodeid (str): The hex string of the node id.

Returns:
The storage node dictionary. The return type is *dict*.

getStorNodes()

Get buid, sode tuples representing the data stored in the layer.

Notes:
The storage nodes represent **only** the data stored in the layer and may not represent whole nodes.

Yields:
Tuple of buid, sode values. The return type is *list*.

getTagCount(tagname, formname=$lib.null)

Return the number of tag rows in the layer for the given tag and optional form.

Examples:
Get the number of `inet:ipv4` nodes with the `$foo.bar` tag:

```
$count = $lib.layer.get().getTagCount(foo.bar, formname=inet:ipv4)
```

Args:
tagname (str): The name of the tag to look up.

formname (str): The form to constrain the look up by.

Returns:
The count of tag rows. The return type is `int`.

getTagPropCount(tag, propname, form=$lib.null, valu=$lib.undef)

Get the number of rows in the layer for the given tag property.

Args:
tag (str): The tag to look up.

propname (str): The property name to look up.

form (str): The optional form to look up.

valu (any): A specific value of the property to look up.

Returns:
The count of rows. The return type is `int`.

iden

The iden of the Layer.

Returns:
The type is *str*.

liftByProp(propname, propvalu=$lib.null, propcmpr==)

Lift and yield nodes with the property and optional value set within the layer.

Example:
Yield all nodes with the property `ou:org:name` set in the top layer:

```
yield $lib.layer.get().liftByProp(ou:org:name)
```

Yield all nodes with the property `ou:org:name=woot` in the top layer:

```
yield $lib.layer.get().liftByProp(ou:org:name, woot)
```

Yield all nodes with the property `ou:org:name^=woot` in the top layer:

```
yield $lib.layer.get().liftByProp(ou:org:name, woot, "^=")
```

Args:
propname (str): The full property name to lift by.

propvalu (obj): The value for the property.

propcmpr (str): The comparison operation to use on the value.

Yields:
Yields nodes. The return type is *node*.

liftByTag(tagname, formname=$lib.null)

Lift and yield nodes with the tag set within the layer.

Example:
Yield all nodes with the tag #foo set in the layer:

```
yield $lib.layer.get().liftByTag(foo)
```

Yield all inet:fqdn with the tag #foo set in the layer:

```
yield $lib.layer.get().liftByTag(foo, inet:fqdn)
```

Args:
tagname (str): The tag name to lift by.

formname (str): The optional form to lift.

Yields:
Yields nodes. The return type is *node*.

pack()

Get the Layer definition.

Returns:
Dictionary containing the Layer definition. The return type is *dict*.

repr()

Get a string representation of the Layer.

Returns:
A string that can be printed, representing a Layer. The return type is *str*.

set(name, valu)

Set an arbitrary value in the Layer definition.

Args:
name (str): The name to set.

valu (any): The value to set.

Returns:
The return type is `null`.

verify(config=$lib.null)

Verify consistency between the node storage and indexes in the given layer.

Example:
Get all messages about consistency issues in the default layer:

```
for $mesg in $lib.layer.get().verify() {
    $lib.print($mesg)
}
```

Notes:
The config format argument and message format yielded by this API is considered BETA and may be subject to change! The formats will be documented when the convention stabilizes.

Args:
config (dict): The scan config to use (default all enabled).

Yields:
Yields messages describing any index inconsistencies. The return type is *list*.

13.2.28 list

Implements the Storm API for a List instance.

append(valu)

Append a value to the list.

Args:
valu (any): The item to append to the list.

Returns:
The return type is `null`.

extend(valu)

Extend a list using another iterable.

Examples:
Populate a list by extending it with to other lists:

```
$list = $lib.list()

$foo = (f, o, o)
$bar = (b, a, r)

$list.extend($foo)
$list.extend($bar)

// $list is now (f, o, o, b, a, r)
```

Args:
valu (list): A list or other iterable.

Returns:
The return type is `null`.

has(valu)

Check if a value is in the list.

Args:
valu (any): The value to check.

Returns:
True if the item is in the list, false otherwise. The return type is *boolean*.

index(valu)

Return a single field from the list by index.

Args:
valu (int): The list index value.

Returns:
The item present in the list at the index position. The return type is `any`.

length()

Get the length of the list. This is deprecated; please use `.size()` instead.

Returns:
The size of the list. The return type is `int`.

pop()

Pop and return the last entry in the list.

Returns:
The last item from the list. The return type is `any`.

reverse()

Reverse the order of the list in place

Returns:
The return type is `null`.

size()

Return the length of the list.

Returns:
The size of the list. The return type is `int`.

slice(start, end=$lib.null)

Get a slice of the list.

Examples:
Slice from index to 1 to 5:

```
$x=(f, o, o, b, a, r)
$y=$x.slice(1,5)  // (o, o, b, a)
```

Slice from index 3 to the end of the list:

```
$y=$x.slice(3)  // (b, a, r)
```

Args:
start (int): The starting index.

end (int): The ending index. If not specified, slice to the end of the list.

Returns:
The slice of the list. The return type is *list*.

sort(reverse=$lib.false)

Sort the list in place.

Args:
reverse (bool): Sort the list in reverse order.

Returns:
The return type is `null`.

unique()

Get a copy of the list containing unique items.

Returns:
The return type is *list*.

13.2.29 model:form

Implements the Storm API for a Form.

name

The name of the Form

Returns:
The type is *str*.

prop(name)

Get a Property on the Form

Args:
name (str): The property to retrieve.

Returns:
The `model:property` instance if the property if present on the form or null. The return type may be one of the following: *model:property*, `null`.

type

Get the Type for the form.

Returns:
The return type is *model:type*.

13.2.30 model:property

Implements the Storm API for a Property.

form

Get the Form for the Property.

Returns:
The return type may be one of the following: *model:form*, `null`.

full

The full name of the Property.

Returns:
The type is *str*.

name

The short name of the Property.

Returns:
The type is *str*.

type

Get the Type for the Property.

Returns:
The return type is *model:type*.

13.2.31 model:tagprop

Implements the Storm API for a Tag Property.

name

The name of the Tag Property.

Returns:
The type is *str*.

type

Get the Type for the Tag Property.

Returns:
The return type is *model:type*.

13.2.32 model:type

A Storm types wrapper around a lib.types.Type

name

The name of the Type.

Returns:
The type is *str*.

norm(valu)

Get the norm and info for the Type.

Args:
valu (any): The value to norm.

Returns:
A tuple of the normed value and its information dictionary. The return type is *list*.

repr(valu)

Get the repr of a value for the Type.

Args:
valu (any): The value to get the repr of.

Returns:
The string form of the value as represented by the type. The return type is *str*.

stortype

The storetype of the Type.

Returns:
The type is `int`.

13.2.33 node

Implements the Storm api for a node instance.

addEdge(verb, iden)

Add a light-weight edge.

Args:
verb (str): The edge verb to add.

iden (str): The node id of the destination node.

Returns:
The return type is `null`.

delEdge(verb, iden)

Remove a light-weight edge.

Args:
verb (str): The edge verb to remove.

iden (str): The node id of the destination node to remove.

Returns:
The return type is `null`.

difftags(tags, prefix=$lib.null, apply=$lib.false, norm=$lib.false)

Get and optionally apply the difference between the current set of tags and another set.

Args:
tags (list): The set to compare against.

prefix (str): An optional prefix to match tags under.

apply (boolean): If true, apply the diff.

norm (boolean): Optionally norm the list of tags. If a prefix is provided, it will not be normed.

Returns:
The tags which have been added/deleted in the new set. The return type is *dict*.

edges(verb=$lib.null, reverse=$lib.false)

Yields the (verb, iden) tuples for this nodes edges.

Args:
    verb (str): If provided, only return edges with this verb.

    reverse (boolean): If true, yield edges with this node as the dest rather than source.

Yields:
    A tuple of (verb, iden) values for this nodes edges. The return type is *list*.

form()

Get the form of the Node.

Returns:
    The form of the Node. The return type is *str*.

getByLayer()

Return a dict you can use to lookup which props/tags came from which layers.

Returns:
    property / tag lookup dictionary. The return type is *dict*.

getStorNodes()

Return a list of "storage nodes" which were fused from the layers to make this node.

Returns:
    List of storage node objects. The return type is *list*.

globtags(glob)

Get a list of the tag components from a Node which match a tag glob expression.

Args:
    glob (str): The glob expression to match.

Returns:
    The components of tags which match the wildcard component of a glob expression. The return type is *list*.

iden()

Get the iden of the Node.

Returns:
    The nodes iden. The return type is *str*.

isform(name)

Check if a Node is a given form.

Args:
name (str): The form to compare the Node against.

Returns:
True if the form matches, false otherwise. The return type is *boolean*.

ndef()

Get the form and primary property of the Node.

Returns:
A tuple of the form and primary property. The return type is *list*.

pack(dorepr=$lib.false)

Return the serializable/packed version of the Node.

Args:
dorepr (boolean): Include repr information for human readable versions of properties.

Returns:
A tuple containing the ndef and property bag of the node. The return type is *list*.

repr(name=$lib.null, defv=$lib.null)

Get the repr for the primary property or secondary property of a Node.

Args:
name (str): The name of the secondary property to get the repr for.

defv (str): The default value to return if the secondary property does not exist

Returns:
The string representation of the requested value. The return type is *str*.

tags(glob=$lib.null, leaf=$lib.false)

Get a list of the tags on the Node.

Notes:
When providing a glob argument, the following rules are used. A single asterisk(*) will replace exactly one dot-delimited component of a tag. A double asterisk(**) will replace one or more of any character.

Args:
glob (str): A tag glob expression. If this is provided, only tags which match the expression are returned.

leaf (bool): If true, only leaf tags are included in the returned tags.

Returns:
A list of tags on the node. If a glob match is provided, only matching tags are returned. The return type is *list*.

value()

Get the value of the primary property of the Node.

Returns:
The primary property. The return type is `prim`.

13.2.34 node:data

A Storm Primitive representing the NodeData stored for a Node.

cacheget(name, asof=now)

Retrieve data stored with cacheset() if it was stored more recently than the asof argument.

Args:
name (str): The name of the data to load.

asof (time): The max cache age.

Returns:
The cached value or null. The return type is `prim`.

cacheset(name, valu)

Set a node data value with an envelope that tracks time for cache use.

Args:
name (str): The name of the data to set.

valu (prim): The data to store.

Returns:
The return type is `null`.

get(name)

Get the Node data for a given name for the Node.

Args:
name (str): Name of the data to get.

Returns:
The stored node data. The return type is `prim`.

has(name)

Check if the Node data has the given key set on it

Args:
name (str): Name of the data to check for.

Returns:
True if the key is found, otherwise false. The return type is *boolean*.

list()

Get a list of the Node data names on the Node.

Returns:
List of the names of values stored on the node. The return type is *list*.

load(name)

Load the Node data onto the Node so that the Node data is packed and returned by the runtime.

Args:
name (str): The name of the data to load.

Returns:
The return type is `null`.

pop(name)

Pop (remove) a the Node data from the Node.

Args:
name (str): The name of the data to remove from the node.

Returns:
The data removed. The return type is `prim`.

set(name, valu)

Set the Node data for a given name on the Node.

Args:
name (str): The name of the data.

valu (prim): The data to store.

Returns:
The return type is `null`.

13.2.35 node:path

Implements the Storm API for the Path object.

idens()

The list of Node idens which this Path has been forked from during pivot operations.

Returns:
A list of node idens. The return type is *list*.

listvars()

List variables available in the path of a storm query.

Returns:
List of tuples containing the name and value of path variables. The return type is *list*.

meta

The PathMeta object for the Path.

Returns:
The type is *node:path:meta*.

vars

The PathVars object for the Path.

Returns:
The type is *node:path:vars*.

13.2.36 node:path:meta

Put the storm deref/setitem/iter convention on top of path meta information.

13.2.37 node:path:vars

Put the storm deref/setitem/iter convention on top of path variables.

13.2.38 node:props

A Storm Primitive representing the properties on a Node.

get(name)

Get a specific property value by name.

Args:
name (str): The name of the property to return.

Returns:
The requested value. The return type is `prim`.

list()

List the properties and their values from the `$node`.

Returns:
A list of (name, value) tuples. The return type is *list*.

set(prop, valu)

Set a specific property value by name.

Args:
prop (str): The name of the property to set.

valu (prim): The value to set the property to.

Returns:
The set value. The return type is `prim`.

13.2.39 number

Implements the Storm API for a Number instance.

Storm Numbers are high precision fixed point decimals corresponding to the the hugenum storage type.

scaleb(other)

Return the number multiplied by 10**other.

Example:
Multiply the value by 10**-18:

```
$baz.scaleb(-18)
```

Args:
other (int): The amount to adjust the exponent.

Returns:
The exponent adjusted number. The return type is *number*.

tofloat()

Return the number as a float.

Returns:
The number as a float. The return type is `float`.

toint(rounding=$lib.null)

Return the number as an integer.

By default, decimal places will be truncated. Optionally, rounding rules can be specified by providing the name of a Python decimal rounding mode to the 'rounding' argument.

Example:
Round the value stored in $baz up instead of truncating:

```
$baz.toint(rounding=ROUND_UP)
```

Args:
rounding (str): An optional rounding mode to use.

Returns:
The number as an integer. The return type is `int`.

tostr()

Return the number as a string.

Returns:
The number as a string. The return type is *str*.

13.2.40 pipe

A Storm Pipe provides fast ephemeral queues.

put(item)

Add a single item to the Pipe.

Args:
item (any): An object to add to the Pipe.

Returns:
The return type is `null`.

puts(items)

Add a list of items to the Pipe.

Args:
items (list): A list of items to add.

Returns:
The return type is `null`.

size()

Retrieve the number of items in the Pipe.

Returns:
The number of items in the Pipe. The return type is `int`.

slice(size=(1000))

Return a list of up to size items from the Pipe.

Args:
size (int): The max number of items to return.

Returns:
A list of at least 1 item from the Pipe. The return type is *list*.

slices(size=(1000))

Yield lists of up to size items from the Pipe.

Notes:
The loop will exit when the Pipe is closed and empty.

Examples:
Operation on slices from a pipe one at a time:

```
for $slice in $pipe.slices(1000) {
    for $item in $slice { $dostuff($item) }
}
```

Operate on slices from a pipe in bulk:

```
for $slice in $pipe.slices(1000) {
    $dostuff_batch($slice)
}
```

Args:
size (int): The max number of items to yield per slice.

Yields:
Yields objects from the Pipe. The return type is `any`.

13.2.41 proj:comment

Implements the Storm API for a ProjectTicketComment

del()

Delete the comment.

Returns:
True if the ProjectTicketComment was deleted The return type is *boolean*.

text

The comment text. This can be used to set the text as well.

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

13.2.42 proj:comments

Implements the Storm API for ProjectTicketComments objects, which are collections of comments associated with a ticket.

add(text)

Add a comment to the ticket.

Args:
text (str): The text for the new ProjectTicketComment.

Returns:
The newly created *proj:comment* object The return type is *proj:comment*.

get(guid)

Get a ticket comment by guid.

Args:
guid (str): The guid of the ProjectTicketComment to get.

Returns:
The *proj:comment* object The return type is *proj:comment*.

13.2.43 proj:epic

Implements the Storm API for a ProjectEpic

name

The name of the Epic. This can be used to set the name as well.

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

13.2.44 proj:epics

Implements the Storm API for ProjectEpics objects, which are collections of ProjectEpic objects associated with a particular Project

add(name)

Add an epic.

Args:
name (str): The name for the new ProjectEpic.

Returns:
The newly created *proj:epic* object The return type is *proj:epic*.

del(name)

Delete an epic by name.

Args:
name (str): The name of the ProjectEpic to delete.

Returns:
True if the ProjectEpic can be found and deleted, otherwise False The return type is *boolean*.

get(name)

Get an epic by name.

Args:
name (str): The name (or iden) of the ProjectEpic to get.

Returns:
The *proj:epic* object The return type is *proj:epic*.

13.2.45 proj:project

Implements the Storm API for Project objects, which are used for managing a scrum style project in the Cortex

epics

A *proj:epics* object that contains the epics associated with the given project.

Returns:
The return type is *proj:epics*.

name

The name of the project. This can also be used to set the name of the project.

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

sprints

A *proj:sprints* object that contains the sprints associated with the given project.

Returns:
The return type is *proj:sprints*.

tickets

A *proj:tickets* object that contains the tickets associated with the given project.

Returns:
The return type is *proj:tickets*.

13.2.46 proj:sprint

Implements the Storm API for a ProjectSprint

desc

A description of the sprint. This can also be used to set the description.

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

name

The name of the sprint. This can also be used to set the name.

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

status

The status of the sprint. This can also be used to set the status.

Returns:
The return type may be one of the following: `int`, `null`. When this is used to set the value, it does not have a return type.

tickets

Yields out the tickets associated with the given sprint (no call needed).

Returns:
The return type is `generator`.

13.2.47 proj:sprints

Implements the Storm API for ProjectSprints objects, which are collections of sprints associated with a single project

add(name, period=$lib.null)

Add a sprint.

Args:
name (str): The name for the new ProjectSprint.

period (ival): The time interval the ProjectSprint runs for

Returns:
The newly created *proj:sprint* object The return type is *proj:sprint*.

del(name)

Delete a sprint by name.

Args:
name (str): The name of the Sprint to delete.

Returns:
True if the ProjectSprint can be found and deleted, otherwise False The return type is *boolean*.

get(name)

Get a sprint by name.

Args:
name (str): The name (or iden) of the ProjectSprint to get.

Returns:
The *proj:sprint* object The return type is *proj:sprint*.

13.2.48 proj:ticket

Implements the Storm API for a ProjectTicket.

assignee

The user the ticket is assigned to. This can be used to set the assignee of the ticket.

Returns:
The return type may be one of the following: `int`, `null`. When this is used to set the value, it does not have a return type.

comments

A `proj:comments` object that contains comments associated with the given ticket.

Returns:
The return type is *proj:comments*.

desc

A description of the ticket. This can be used to set the description.

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

epic

The epic associated with the ticket. This can be used to set the epic.

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

name

The name of the ticket. This can be used to set the name of the ticket.

Returns:
The return type may be one of the following: *str*, `null`. When this is used to set the value, it does not have a return type.

priority

An integer value from the enums [0, 10, 20, 30, 40, 50] of the priority of the ticket. This can be used to set the priority of the ticket.

Returns:
The return type may be one of the following: `int`, `null`. When this is used to set the value, it does not have a return type.

sprint

The sprint the ticket is in. This can be used to set the sprint this ticket is in.

Returns:
The return type may be one of the following: `int`, `null`. When this is used to set the value, it does not have a return type.

status

The status of the ticket. This can be used to set the status of the ticket.

Returns:
The return type may be one of the following: `int`, `null`. When this is used to set the value, it does not have a return type.

13.2.49 proj:tickets

Implements the Storm API for ProjectTickets objects, which are collections of tickets associated with a project

add(name, desc=)

Add a ticket.

Args:
name (str): The name for the new ProjectTicket.

desc (str): A description of the new ticket

Returns:
The newly created *proj:ticket* object The return type is *proj:ticket*.

del(name)

Delete a sprint by name.

Args:
name (str): The name of the ProjectTicket to delete.

Returns:
True if the ProjectTicket can be found and deleted, otherwise False The return type is *boolean*.

get(name)

Get a ticket by name.

Args:
name (str): The name (or iden) of the ProjectTicket to get.

Returns:
The *proj:ticket* object The return type is *proj:ticket*.

13.2.50 queue

A StormLib API instance of a named channel in the Cortex multiqueue.

cull(offs)

Remove items from the queue up to, and including, the offset.

Args:
offs (int): The offset which to cull records from the queue.

Returns:
The return type is `null`.

get(offs=(0), cull=$lib.true, wait=$lib.true)

Get a particular item from the Queue.

Args:
offs (int): The offset to retrieve an item from.

cull (boolean): Culls items up to, but not including, the specified offset.

wait (boolean): Wait for the offset to be available before returning the item.

Returns:
A tuple of the offset and the item from the queue. If wait is false and the offset is not present, null is returned. The return type is *list*.

gets(offs=(0), wait=$lib.true, cull=$lib.false, size=$lib.null)

Get multiple items from the Queue as a iterator.

Args:
offs (int): The offset to retrieve an items from.

wait (boolean): Wait for the offset to be available before returning the item.

cull (boolean): Culls items up to, but not including, the specified offset.

size (int): The maximum number of items to yield

Yields:
Yields tuples of the offset and item. The return type is *list*.

name

The name of the Queue.

Returns:
The type is *str*.

pop(offs=$lib.null, wait=$lib.false)

Pop a item from the Queue at a specific offset.

Args:
offs (int): Offset to pop the item from. If not specified, the first item in the queue will be popped.

wait (boolean): Wait for an item to be available to pop.

Returns:
The offset and item popped from the queue. If there is no item at the offset or the queue is empty and wait is false, it returns null. The return type is *list*.

put(item)

Put an item into the queue.

Args:
item (prim): The item being put into the queue.

Returns:
The return type is `null`.

puts(items)

Put multiple items into the Queue.

Args:
items (list): The items to put into the Queue.

Returns:
The return type is `null`.

size()

Get the number of items in the Queue.

Returns:
The number of items in the Queue. The return type is `int`.

13.2.51 set

Implements the Storm API for a Set object.

add(*items)

Add a item to the set. Each argument is added to the set.

Args:
*items (any): The items to add to the set.

Returns:
The return type is `null`.

adds(*items)

Add the contents of a iterable items to the set.

Args:
*items (any): Iterables items to add to the set.

Returns:
The return type is `null`.

has(item)

Check if a item is a member of the set.

Args:
item (any): The item to check the set for membership.

Returns:
True if the item is in the set, false otherwise. The return type is *boolean*.

list()

Get a list of the current members of the set.

Returns:
A list containing the members of the set. The return type is *list*.

rem(*items)

Remove an item from the set.

Args:
*items (any): Items to be removed from the set.

Returns:
The return type is `null`.

rems(*items)

Remove the contents of a iterable object from the set.

Args:
*items (any): Iterables items to remove from the set.

Returns:
The return type is `null`.

size()

Get the size of the set.

Returns:
The size of the set. The return type is `int`.

13.2.52 spooled:set

A StormLib API instance of a Storm Set object that can fallback to lmdb.

add(*items)

Add a item to the set. Each argument is added to the set.

Args:
*items (any): The items to add to the set.

Returns:
The return type is `null`.

adds(*items)

Add the contents of a iterable items to the set.

Args:
*items (any): Iterables items to add to the set.

Returns:
The return type is `null`.

has(item)

Check if a item is a member of the set.

Args:
item (any): The item to check the set for membership.

Returns:
True if the item is in the set, false otherwise. The return type is *boolean*.

list()

Get a list of the current members of the set.

Returns:
A list containing the members of the set. The return type is *list*.

rem(*items)

Remove an item from the set.

Args:
*items (any): Items to be removed from the set.

Returns:
The return type is `null`.

rems(*items)

Remove the contents of a iterable object from the set.

Args:
*items (any): Iterables items to remove from the set.

Returns:
The return type is `null`.

size()

Get the size of the set.

Returns:
The size of the set. The return type is `int`.

13.2.53 stat:tally

A tally object.

An example of using it:

```
$tally = $lib.stats.tally()

$tally.inc(foo)

for $name, $total in $tally {
    $doStuff($name, $total)
}
```

get(name)

Get the value of a given counter.

Args:
name (str): The name of the counter to get.

Returns:
The value of the counter, or 0 if the counter does not exist. The return type is `int`.

inc(name, valu=(1))

Increment a given counter.

Args:
name (str): The name of the counter to increment.

valu (int): The value to increment the counter by.

Returns:
The return type is `null`.

sorted(byname=$lib.false, reverse=$lib.false)

Get a list of (counter, value) tuples in sorted order.

Args:
byname (bool): Sort by counter name instead of value.

reverse (bool): Sort in descending order instead of ascending order.

Returns:
List of (counter, value) tuples in sorted order. The return type is *list*.

13.2.54 stix:bundle

Implements the Storm API for creating and packing a STIX bundle for v2.1

add(node, stixtype=$lib.null)

Make one or more STIX objects from a node, and add it to the bundle.

Examples:
Example Storm which would be called remotely via the `callStorm()` API:

```
init { $bundle = $lib.stix.bundle() }
#aka.feye.thr.apt1
$bundle.add($node)
fini { return($bundle) }
```

Args:
node (node): The node to make a STIX object from.

stixtype (str): The explicit name of the STIX type to map the node to. This will override the default mapping.

Returns:
The stable STIX id of the added object. The return type is *str*.

pack()

Return the bundle as a STIX JSON object.

Returns:
The return type is *dict*.

size()

Return the number of STIX objects currently in the bundle.

Returns:
The return type is `int`.

13.2.55 storm:query

A storm primitive representing an embedded query.

exec()

Execute the Query in a sub-runtime.

Notes:
The `.exec()` method can return a value if the Storm query contains a `return( ... )` statement in it.

Returns:
A value specified with a return statement, or none. The return type may be one of the following: `null`, `any`.

size(limit=(1000))

Execute the Query in a sub-runtime and return the number of nodes yielded.

Args:
limit (int): Limit the maximum number of nodes produced by the query.

Returns:
The number of nodes yielded by the query. The return type is `int`.

13.2.56 str

Implements the Storm API for a String object.

encode(encoding=utf8)

Encoding a string value to bytes.

Args:
encoding (str): Encoding to use. Defaults to utf8.

Returns:
The encoded string. The return type is *bytes*.

endswith(text)

Check if a string ends with text.

Args:
text (str): The text to check.

Returns:
True if the text ends with the string, false otherwise. The return type is *boolean*.

find(valu)

Find the offset of a given string within another.

Examples:
Find values in the string `asdf`:

```
$x = asdf
$x.find(d) // returns 2
$x.find(v) // returns null
```

Args:
valu (str): The substring to find.

Returns:
The first offset of substring or null. The return type is `int`.

format(**kwargs)

Format a text string from an existing string.

Examples:
Format a string with a fixed argument and a variable:

```
$template='Hello {name}, list is {list}!' $list=(1,2,3,4) $new=$template.
↪format(name='Reader', list=$list)
```

Args:
**kwargs (any): Keyword values which are substituted into the string.

Returns:
The new string. The return type is *str*.

json()

Parse a JSON string and return the deserialized data.

Returns:
The JSON deserialized object. The return type is `prim`.

ljust(size, fillchar=)

Left justify the string.

Args:
size (int): The length of character to left justify.

fillchar (str): The character to use for padding.

Returns:
The left justified string. The return type is *str*.

lower()

Get a lowercased copy of the string.

Examples:
Printing a lowercased string:

```
$foo="Duck"
$lib.print($foo.lower())
```

Returns:
The lowercased string. The return type is *str*.

lstrip(chars=$lib.null)

Remove leading characters from a string.

Examples:
Removing whitespace and specific characters:

```
$strippedFoo = $foo.lstrip()
$strippedBar = $bar.lstrip(w)
```

Args:
chars (str): A list of characters to remove. If not specified, whitespace is stripped.

Returns:
The stripped string. The return type is *str*.

replace(oldv, newv, maxv=$lib.null)

Replace occurrences of a string with a new string, optionally restricting the number of replacements.

Example:
Replace instances of the string “bar” with the string “baz”:

```
$foo.replace('bar', 'baz')
```

Args:
oldv (str): The value to replace.

newv (str): The value to add into the string.

maxv (int): The maximum number of occurrences to replace.

Returns:
The new string with replaced instances. The return type is *str*.

reverse()

Get a reversed copy of the string.

Examples:
Printing a reversed string:

```
$foo="foobar"
$lib.print($foo.reverse())
```

Returns:
The reversed string. The return type is *str*.

rjust(size, fillchar=)

Right justify the string.

Args:
size (int): The length of character to right justify.

fillchar (str): The character to use for padding.

Returns:
The right justified string. The return type is *str*.

rsplit(text, maxsplit=(-1))

Split the string into multiple parts, from the right, based on a separator.

Example:
Split a string on the colon character:

```
($foo, $bar) = $baz.rsplit(":", maxsplit=1)
```

Args:
text (str): The text to split the string up with.

maxsplit (int): The max number of splits.

Returns:
A list of parts representing the split string. The return type is *list*.

rstrip(chars=$lib.null)

Remove trailing characters from a string.

Examples:
Removing whitespace and specific characters:

```
$strippedFoo = $foo.rstrip()
$strippedBar = $bar.rstrip(asdf)
```

Args:
chars (str): A list of characters to remove. If not specified, whitespace is stripped.

Returns:
The stripped string. The return type is *str*.

size()

Return the length of the string.

Returns:
The size of the string. The return type is `int`.

slice(start, end=$lib.null)

Get a substring slice of the string.

Examples:
Slice from index to 1 to 5:

```
$x="foobar"
$y=$x.slice(1,5)  // "ooba"
```

Slice from index 3 to the end of the string:

```
$y=$x.slice(3)  // "bar"
```

Args:
start (int): The starting character index.

end (int): The ending character index. If not specified, slice to the end of the string

Returns:
The slice substring. The return type is *str*.

split(text, maxsplit=(-1))

Split the string into multiple parts based on a separator.

Example:
Split a string on the colon character:

```
($foo, $bar) = $baz.split(":")
```

Args:
text (str): The text to split the string up with.

maxsplit (int): The max number of splits.

Returns:
A list of parts representing the split string. The return type is *list*.

startswith(text)

Check if a string starts with text.

Args:
text (str): The text to check.

Returns:
True if the text starts with the string, false otherwise. The return type is *boolean*.

strip(chars=$lib.null)

Remove leading and trailing characters from a string.

Examples:
Removing whitespace and specific characters:

```
$strippedFoo = $foo.strip()
$strippedBar = $bar.strip(asdf)
```

Args:
chars (str): A list of characters to remove. If not specified, whitespace is stripped.

Returns:
The stripped string. The return type is *str*.

title()

Get a title cased copy of the string.

Examples:
Printing a title cased string:

```
$foo="Hello world."
$lib.print($foo.title())
```

Returns:
The title cased string. The return type is *str*.

upper()

Get a uppercased copy of the string.

Examples:
Printing a uppercased string:

```
$foo="Duck"
$lib.print($foo.upper())
```

Returns:
The uppercased string. The return type is *str*.

13.2.57 telepath:proxy

Implements the Storm API for a Telepath proxy.

These can be created via `$lib.telepath.open()`. Storm Service objects are also Telepath proxy objects.

Methods called off of these objects are executed like regular Telepath RMI calls.

An example of calling a method which returns data:

```
$prox = $lib.telepath.open($url)
$result = $prox.doWork($data)
return ( $result )
```

An example of calling a method which is a generator:

```
$prox = $lib.telepath.open($url)
for $item in $prox.genrStuff($data) {
    $doStuff($item)
}
```

13.2.58 telepath:proxy:genrmethod

Implements the generator methods for the telepath:proxy.

An example of calling a method which is a generator:

```
$prox = $lib.telepath.open($url)
for $item in $prox.genrStuff($data) {
    $doStuff($item)
}
```

13.2.59 telepath:proxy:method

Implements the call methods for the telepath:proxy.

An example of calling a method which returns data:

```
$prox = $lib.telepath.open($url)
$result = $prox.doWork($data)
$doStuff($result)
```

13.2.60 text

A mutable text type for simple text construction.

add(text, **kwargs)

Add text to the Text object.

Args:
text (str): The text to add.

**kwargs (any): Keyword arguments used to format the text.

Returns:
The return type is `null`.

str()

Get the text content as a string.

Returns:
The current string of the text object. The return type is *str*.

13.2.61 trigger

Implements the Storm API for a Trigger.

iden

The Trigger iden.

Returns:
The type is *str*.

move(viewiden)

Modify the Trigger to run in a different View.

Args:
viewiden (str): The iden of the new View for the Trigger to run in.

Returns:
The return type is `null`.

pack()

Get the trigger definition.

Returns:
The definition. The return type is *dict*.

set(name, valu)

Set information in the Trigger.

Args:
name (str): Name of the key to set.

valu (prim): The data to set

Returns:
The return type is `null`.

13.2.62 vault

Implements the Storm API for a Vault.

Callers (instantiation) of this class must have already checked that the user has at least PERM_READ to the vault.

configs

The Vault configs data.

Returns:
The return type is *vault:data*. When this is used to set the value, it does not have a return type.

delete()

Delete the Vault.

Returns:
$lib.true if the vault was deleted, $lib.false otherwise. The return type is *boolean*.

iden

The Vault iden.

Returns:
The type is *str*.

name

The Vault name.

Returns:
The return type is *str*. When this is used to set the value, it does not have a return type.

owner

The Vault owner (user or role iden).

Returns:
The type is *str*.

permissions

The Vault permissions.

Returns:
The return type is *dict*.

scope

The Vault scope.

Returns:
The type is *str*.

secrets

The Vault secrets data.

Returns:
The return type is *vault:data*. When this is used to set the value, it does not have a return type.

setPerm(iden, level)

Set easy permissions on the Vault.

Args:
iden (str): The user or role to modify.

level (str): The easyperm level for the iden. $lib.undef to remove an existing permission.

Returns:
$lib.true if the permission was set, $lib.false otherwise. The return type is *boolean*.

type

The Vault type.

Returns:
The type is *str*.

13.2.63 vault:data

Implements the Storm API for Vault data. This is used for both vault configs and vault secrets.

13.2.64 view

Implements the Storm api for a View instance.

addNode(form, valu, props=$lib.null)

Transactionally add a single node and all it's properties. If any validation fails, no changes are made.

Args:
form (str): The form name.

valu (prim): The primary property value.

props (dict): An optional dictionary of props.

Returns:
The node if the view is the current view, otherwise null. The return type is *node*.

addNodeEdits(edits)

Add NodeEdits to the view.

Args:
edits (list): A list of nodeedits.

Returns:
The return type is `null`.

delMergeRequest()

Remove the existing merge request.

Returns:
The deleted merge request. The return type is *dict*.

delMergeVote(useriden=$lib.null)

Remove a previously created merge vote.

Notes:
The default use case removes a vote cast by the current user. Specifying the useriden parameter allows you to remove a vote cast by another user but requires global admin permissions.

Args:
useriden (str): Delete a merge vote by a different user.

Returns:
The vote record that was removed. The return type is *dict*.

detach()

Detach the view from its parent. WARNING: This cannot be reversed.

Returns:
The return type is `null`.

fork(name=$lib.null)

Fork a View in the Cortex.

Args:
name (str): The name of the new view.

Returns:
The `view` object for the new View. The return type is *view*.

get(name, defv=$lib.null)

Get a view configuration option.

Args:
name (str): Name of the value to get.

defv (prim): The default value returned if the name is not set in the View.

Returns:
The value requested or the default value. The return type is `prim`.

getEdgeVerbs()

Get the Edge verbs which exist in the View.

Yields:
Yields the edge verbs used by Layers which make up the View. The return type is *str*.

getEdges(verb=$lib.null)

Get node information for Edges in the View.

Args:
verb (str): The name of the Edges verb to iterate over.

Yields:
Yields tuples containing the source iden, verb, and destination iden. The return type is *list*.

getFormCounts()

Get the formcounts for the View.

Example:
Get the formcounts for the current View:

```
$counts = $lib.view.get().getFormCounts()
```

Returns:
Dictionary containing form names and the count of the nodes in the View's Layers. The return type is *dict*.

getMergeRequest()

Return the existing merge request or null.

Returns:
The merge request. The return type is *dict*.

getMergeRequestSummary()

Return the merge request, votes, parent quorum definition, and current layer offset.

Returns:
The summary info. The return type is *dict*.

getMerges()

Yields previously successful merges into the view.

Yields:
Yields previously successful merges into the view. The return type is *dict*.

getMergingViews()

Get a list of idens of Views that have open merge requests to this View.

Idens:
The list of View idens that have an open merge request into this View. The return type is *list*.

getPropArrayCount(propname, valu=$lib.undef)

Get the number of individual array property values in the View for the given array property name.

Notes:
This is a fast approximate count calculated by summing the number of array property values in each layer of the view. Property values which are overwritten by different values in higher layers will still be included in the count.

Args:
propname (str): The property name to look up.

valu (any): The value in the array property to look up.

Returns:
The count of nodes. The return type is `int`.

getPropCount(propname, valu=$lib.undef)

Get the number of nodes in the View with a specific property and optional value.

Notes:
This is a fast approximate count calculated by summing the number of nodes with the property value in each layer of the view. Property values which are overwritten by different values in higher layers will still be included in the count.

Args:
propname (str): The property name to look up.

valu (any): The value of the property to look up.

Returns:
The count of nodes. The return type is `int`.

getTagPropCount(tag, propname, form=$lib.null, valu=$lib.undef)

Get the number of nodes in the View with the given tag property and optional value.

Notes:
This is a fast approximate count calculated by summing the number of nodes with the tag property value in each layer of the view. Values which are overwritten by different values in higher layers will still be included in the count.

Args:
tag (str): The tag to look up.

propname (str): The property name to look up.

form (str): The optional form to look up.

valu (any): The value of the property to look up.

Returns:
The count of nodes. The return type is `int`.

iden

The iden of the View.

Returns:
The type is *str*.

layers

The `layer` objects associated with the `view`.

Returns:
The type is *list*.

merge(force=$lib.false)

Merge a forked View back into its parent View.

Args:
force (boolean): Force the view to merge if possible.

Returns:
The return type is `null`.

pack()

Get the View definition.

Returns:
Dictionary containing the View definition. The return type is *dict*.

parent

The parent View. Will be `$lib.null` if the view is not a fork.

Returns:
The type is *str*.

repr()

Get a string representation of the View.

Returns:
A list of lines that can be printed, representing a View. The return type is *list*.

set(name, valu)

Set a view configuration option.

Current runtime updatable view options include:

name (str)
A terse name for the View.

desc (str)
A description of the View.

parent (str)
The parent View iden.

nomerge (bool)
Deprecated - use protected. Updates to this option will be redirected to the protected option (below) until this option is removed.

protected (bool)
Setting to $lib.true will prevent the layer from being merged or deleted.

layers (list(str))
Set the list of layer idens for a non-forked view. Layers are specified in precedence order with the first layer in the list being the write layer.

quorum (dict)
A dictionary of the quorum settings which require users to vote on merges. {

“count”: <int>, “roles”: [<roleid>, ...]

} Once quorum is enabled for a view, any forks must use the setMergeRequest() API to request that the child view is merged. The $view.addMergeVote() API is used for users to add their votes if they have been granted one of the roles listed. Once the number of approvals are met and there are no vetoes, a background process will kick off which merges the nodes and ultimately deletes the view and top layer.

To maintain consistency with the view.fork() semantics, setting the “parent” option on a view has a few limitations:

- The view must not already have a parent
- The view must not have more than 1 layer

Args:
name (str): The name of the value to set.

valu (prim): The value to set.

Returns:
The return type is `null`.

setMergeComment(comment)

Set the main comment/description of a merge request.

Args:
comment (str): The text comment to set for the merge request

Returns:
The updated merge request. The return type is *dict*.

setMergeRequest(comment=$lib.null)

Setup a merge request for the view in the current state.

Args:
comment (str): A text comment to include in the merge request.

Returns:
The newly created merge request. The return type is *dict*.

setMergeVote(approved=$lib.true, comment=$lib.null)

Register a vote for or against the current merge request.

Args:
approved (boolean): Set to (true) to approve the merge or (false) to veto it.

comment (str): A comment attached to the vote.

Returns:
The vote record that was created. The return type is *dict*.

setMergeVoteComment(comment)

Set the comment associated with your vote on a merge request.

Args:
comment (str): The text comment to set for the merge vote

Returns:
The fully updated vote record. The return type is *dict*.

triggers

The `trigger` objects associated with the `view`.

Returns:
The type is *list*.

wipeLayer()

Delete all nodes and nodedata from the write layer. Triggers will be run.

Returns:
The return type is `null`.

13.2.65 xml:element

A Storm object for dealing with elements in an XML tree.

attrs

The element attributes list.

Returns:
The type is *dict*.

find(name, nested=$lib.true)

Find all nested elements with the specified tag name.

Args:
name (str): The name of the XML tag.

nested (bool): Set to $lib.false to only find direct children.

Returns:
A generator which yields xml:elements. The return type is `generator`.

get(name)

Get a single child element by XML tag name.

Args:
name (str): The name of the child XML element tag.

Returns:
The child XML element or $lib.null The return type is *xml:element*.

name

The element tag name.

Returns:
The type is *str*.

text

The element text body.

Returns:
The type is *str*.

CHAPTER

SYNAPSE POWER-UPS

Power-Ups are part of The Vertex Project's commercial offering, Synapse Enterprise. Synapse Enterprise is an on-premises solution that includes Optic (the Synapse UI) and all of the Power-Ups. The license includes unlimited users and does not limit the amount of data or number of instances you deploy. We take a white-glove approach to each deployment where we're with you every step of the way from planning deployment sizes to helping to train your analysts.

Feel free to contact us or request a demo instance.

Power-Ups provide specific add-on capabilities to Synapse via Storm Packages and Services. For example, Power-Ups may provide connectivity to external databases, third-party data sources, or enable functionality such as the ability to manage YARA rules, scans, and matches.

For an introduction to Power-Ups from our analysts and seeing them in use, see the following video introducing them:

The Vertex Project is constantly releasing new Power-Ups and expanding features of existing Power-Ups. If you join the `#synapse-releases` channel in Synapse Slack, you can get realtime notices of these updates!

14.1 Rapid Power-Ups

Rapid Power-Ups are delivered to a Cortex as Storm packages directly, without requiring any additional containers to be deployed. This allows users to rapidly expand the power of their Synapse deployments without needing to engage with additional operations teams in their environments. For an introduction to Rapid Power-Ups and some information about publicly available Power-Ups, see the following blog post.

See the Rapid Power-Ups List for a complete list of all available Rapid Power-Ups.

14.1.1 Getting Started with Rapid Power-Ups

Vertex maintains a package repository which allows for loading public and private packages.

If you are a *Synapse User Interface* user, you can navigate to the **Power-Ups Tool** to register your Cortex and configure packages.

Alternatively, one can use the *storm* tool to get started with Rapid Power-Ups in their Cortex.

See our blog article for a step-by step guide to registering your Cortex to install the free `synapse-misp`, `synapse-mitre-attack`, and `synapse-tor` Power-Ups.

14.2 Advanced Power-Ups

Advanced Power-Ups are enhancements to a Cortex which require the deployment of additional containers in order to run their services.

Documentation for specific Advanced Power-Ups can be found here:

- Synapse Backup
- Synapse Fileparser
- Synapse Maxmind
- Synapse GCS
- Synapse Metrics
- Synapse Nettools
- Synapse NSRL
- Synapse Playwright
- Synapse Rapid7
- Synapse Rapid7 SonarRDNS
- Synapse S3
- Synapse Search
- Synapse Sidepocket
- Synapse Swarm
- Synapse Yara
- Synapse Axon Azure

CHAPTER

SYNAPSE USER INTERFACE

Optic (the Synapse UI) is part of The Vertex Project's commercial offering, Synapse Enterprise. Synapse Enterprise is an on-premises solution that includes Optic and all of the Power-Ups. The license includes unlimited users and does not limit the amount of data or number of instances you deploy. We take a white-glove approach to each deployment where we're with you every step of the way from planning deployment sizes to helping to train your analysts.

Feel free to contact us or request a demo instance.

For additional information see the Optic Documentation.

CHAPTER

SIXTEEN

SYNAPSE SUPPORT

Information for Vertex support.

16.1 Slack

Best effort chat based support is available through the Synapse Slack. You can find Vertex Project analysts, engineers, and other users who can help with questions you may have.

16.2 Service Desk

Commercial customers have access to the Vertex Support Service Desk. This is the ideal place for customers to submit issues, modeling questions, and feature requests.

CHAPTER

SEVENTEEN

SYNAPSE CHANGELOG

17.1 v2.167.0 - 2024-04-19

17.1.1 Automatic Migrations

- Set the `protected` flag on all Views in the Cortex, using the existing value of the `nomerge` flag. (#3681)
- See *Data Migration* for more information about automatic migrations.

17.1.2 Model Changes

- Updates to the `base` and `file` models. (#3674) (#3688)

  Updated Types

  `file:path`
  Normalizing paths such as `../.././..` previously failed. This now produces an empty path.

  Deprecated Types

  The following types have been marked as deprecated:

  - `edge`
  - `timeedge`

  Deprecated Forms

  The following forms have been marked as deprecated:

  - `graph:cluster`
  - `graph:node`
  - `graph:event`
  - `edge:refs`
  - `edge:has`
  - `edge:wentto`
  - `graph:edge`
  - `graph:timeedge`

17.1.3 Features and Enhancements

- Add `aha.svc.list` and `aha.svc.stat` commands to enumerate the AHA services. Add `$lib.aha` Storm APIs to delete, get, and list the AHA services. (#3685) (#3692) (#3693)
- Add a `protected` option that can be set on Views to prevent merging and deletion. This replaces the `nomerge` option. (#3679)
- Add Beholder events for creating, deleting, and updating Macros. (#3681)
- Update the `StormPkgTest.getTestCore()` API to add a `prepkghook` callback option. This can be used to execute code prior to loading Storm packages. The `getTestCore()` API now waits for `onload` handlers to complete for each package it loads. (#3687)
- Ensure that the `Cell.ahaclient` is fully owned and managed by the `Cell`. It will no longer use a global client that may exist. (#3677)
- Update the `stix2-validator` library constraints to `>=3.2.0,<4.0.0`. Update the allowed range of the `idna` library to `>=3.6,<3.8`. (#3672) (#3684)

17.1.4 Bugfixes

- Asyncio Tasks created by signal handlers on the Base object are now held onto, to ensure that they cannot be garbage collected before or during their task execution. (#3686)
- Update the `Axon.postfiles` and `Axon.wput` APIs to check for the existence of files before attempting to send them over an HTTP connection. (#3682)
- Fix an issue where pruning a non-existent tag mistakenly pruned related tags. (#3673)
- Ensure that macro names are at least 1 character in length. (#3679)
- Fix a bug where `$lib.telepath.open()` could leak Python exceptions into the Storm runtime. (#3685)

17.1.5 Improved Documentation

- Add documentation for `$lib.aha`, `$lib.aha.pool`, and the `aha:pool` type. (#3685)

17.1.6 Deprecations

- Deprecate the use of `hiveboot.yaml` to configure a Cell hive. This will be removed on 2024-05-05. (#3678)
- The `nomerge` option on views has been deprecated. It is automatically redirected to the `protected` option. This redirection will be removed in `v3.0.0`. (#3681)
- The Telepath APIs for interacting with a Cell Hive, `listHiveKey`, `getHiveKeys`, `getHiveKey`, `setHiveKey`, `popHiveKey`, and `saveHiveTree` have been deprecated. The tools `synapse.tools.hive.load` and `synapse.tools.hive.save` have been deprecated. These will be removed in `v3.0.0`. (#3683)
- The `Telepath.Pipeline` class has been marked as deprecated and will be removed in `v3.0.0`. (#3691)

17.2 v2.166.0 - 2024-04-05

17.2.1 Model Changes

- Updates to the `inet`, `ou`, `person` and `risk` models. (#3649) (#3653) (#3657)

  New Forms

  `inet:tls:handshake`
  An instance of a TLS handshake between a server and client.

  `inet:tls:ja3:sample`
  A JA3 sample taken from a client.

  `inet:tls:ja3s:sample`
  A JA3 sample taken from a server.

  `inet:tls:servercert`
  An x509 certificate sent by a server for TLS.

  `inet:tls:clientcert`
  An x509 certificate sent by a client for TLS.

  New Properties

  `risk:extortion`
  The form had the following property added to it:

  `deadline`
  The time that the demand must be met.

  `risk:leak`
  The form had the following properties added on it:

  `extortion`
  The extortion event which used the threat of the leak as leverage.

  `size:bytes`
  The approximate uncompressed size of the total data leaked.

  `it:mitre:attack:technique`
  The form had the following properties updated on it:

  `name`
  This property is now lower-cased and single spaced.

  Deprecated Forms

  The following forms have been marked as deprecated:

  `inet:ssl:cert`
  Please use `inet:tls:clientcert` or `inet:tls:servercert`.

  Column Display Hints

  The following forms had column display hints added to them:

  `ou:campaign` `ou:conference` `ou:goal` `ou:org` `ou:team` `ou:technique` `ps:contact` `ps:skill` `ps:proficiency` `risk:threat` `risk:compromise` `risk:mitigation` `risk:tool:software`

  Light Edges

uses

When used with a `risk:extortion` and an `ou:technique` node, the edge indicates the attacker used the technique to extort the victim.

17.2.2 Features and Enhancements

- When setting a tag on a node, the tag value is now redirected based on parent tags having `:isnow` properties set. (#3650)
- Add a `$lib.spooled.set()` Storm API. This can be used to get a `spooled:set` object. This set will offload the storage of its members to a temporary location on disk when it grows above a certain size. (#3632)
- Add a `$lib.cache.fixed()` Storm API. This can be used to get a `cache:fixed` object. This cache will execute user provided callbacks written in Storm upon a cache miss. (#3661)
- Add a `pool` option to Cron jobs. This can be set to True to enable a Cron job storm query to be executed on a Storm pool member. (#3652)
- Add a `pool` option to Extended HTTP API handlers. This can be set to True to enable an HTTP request handler to be executed on a Storm pool member. (#3663) (#3667)
- Add a new Storm API, `$lib.cortex.httpapi.getByPath()`, that can be used to get an `http:api` object by its path. The `path` value is evaluated in the same order that the HTTP endpoint resolves the handlers. (#3663)
- Add `--list` and `--gate` options to `synapse.tools.modrole` and `synapse.tools.moduser`. (#3632)
- Add a `view.getMergingViews()` Storm API. This returns a list of view idens that have open merge requests on a view. (#3666)
- The Storm API `show:storage` option now includes storage information for any embedded properties. (#3656)
- Update the `LinkShutDown` exception that a Telepath client may raise to indicate that the connection has been disconnected. (#3640)
- Add repr functions for printing the `aha:pool` and `http:api` objects in Storm. (#3663) (#3665)
- The Telepath `Pool` object has been replaced with a new object, `ClientV2`. This is now the only object returned by the `synapse.telepath.open()` API. This is an AHA pool aware Client which can be used to connect to an AHA pool. (#3662)
- Remove the unused Provenance subsystem from the Cortex. (#3655)
- Constrain the `stix2-validator` library to `3.0.0,<3.2.0` due to an API change. This constraint is expected be changed in the next release. (#3669)

17.2.3 Bugfixes

- Fix a bug where a Cortex `promote()` call could hang when tearing down any running Cron jobs. Cron jobs cancelled during a promotion event will be logged but their cancelled status will not be recorded in the Nexus. (#3658)
- Fix a bug where the Storm pool configuration could cause a Cortex to fail to start up. The Storm pool is now configured upon startup but its use is blocked until the Storm pool is ready to service requests. (#3662)
- Ensure that the URL argument provided to `cortex.storm.pool.set` can be parsed as a Telepath URL. Previously any string input was accepted. (#3665)

17.2.4 Improved Documentation

- Update the list of Cortex permissions in the Admin Guide to include `service.add`, `service.del`, `service.get`, and `service.list`. (#3647)
- Update the docstring for the Storm `cortex.storm.pool.del` command to note the effects of removing a pool and the interruption of running queries. (#3665)
- Update the documentation for the Storm `http:api` object to include the `methods` attribute. (#3663)

17.2.5 Deprecations

- The Telepath `task:init` message format has been marked as deprecated and will be removed in `v3.0.0`. This should not affect any users using Synapse `v2.x.x` in their client code. (#3640)
- The authgate with the name `cortex` is not used for permission checking and will be removed in `v3.0.0`. At startup, the Cortex will now check for any use of this authgate and log warning messages. Attempts to set permissions with this gateiden via Storm will produce `warn` messages. (#3648)

17.3 v2.165.0 - 2024-03-25

17.3.1 Automatic Migrations

- Re-normalize `risk:mitigation:name`, `it:mitre:attack:technique:name`, and `it:mitre:attack:mitigation:name` secondary properties. (#3585)
- Re-normalize `velocity` properties which are float values. (#3616)
- See *Data Migration* for more information about automatic migrations.

17.3.2 Model Changes

- Add a new model, `sci`, for modeling elements of the scientific method. Updates to the `econ`, `file`, `infotech`, `inet`, `ou`, `ps`, and `risk` models. (#3559) (#3585) (#3595) (#3604) (#3606) (#3622) (#3635)

  New Forms

  `econ:acct:receipt`
  : A receipt issued as proof of payment.

  `econ:acct:invoice`
  : An invoice issued requesting payment.

  `econ:bank:account:type:taxonomy`
  : A bank account type taxonomy.

  `econ:bank:account`
  : A bank account.

  `econ:bank:balance`
  : A balance contained by a bank account at a point in time.

  `econ:bank:statement`
  : A statement of bank account payment activity over a period of time.

  `econ:bank:aba:rtn`
  : An American Bank Association (ABA) routing transit number (RTN).

`econ:bank:iban`
An International Bank Account Number.

`econ:bank:swift:bic`
A Society for Worldwide Interbank Financial Telecommunication (SWIFT) Business Identifier Code (BIC).

`risk:vulnerable`
Indicates that a node is susceptible to a vulnerability.

`sci:hypothesis:type:taxonomy`
A taxonomy of hypothesis types.

`sci:hypothesis`
A hypothesis or theory.

`sci:experiment:type:taxonomy`
A taxonomy of experiment types.

`sci:experiment`
An instance of running an experiment.

`sci:observation`
An observation which may have resulted from an experiment.

`sci:evidence`
An assessment of how an observation supports or refutes a hypothesis.

Updated Properties

`risk:mitigation`
The form had the following properties updated on it:

`name`
This property is now lower-cased and single spaced.

`it:mitre:attack:technique`
The form had the following properties updated on it:

`name`
This property is now lower-cased and single spaced.

`it:mitre:attack:mitigation`
The form had the following properties updated on it:

`name`
This property is now lower-cased and single spaced.

New Properties

`econ:acct:payment`
The form had the following properties added to it:

`from:account`
The bank account which made the payment.

`to:account`
The bank account which received the payment.

`invoice`
The invoice that the payment applies to.

`receipt`
The receipt that was issued for the payment.

`file:mime:image`
The interface had the following property added to it:

`text`
The text contained within the image.

`inet:email:message`
The form had the following property added to it:

`flow`
The inet:flow which delivered the message.

`ou:id:number`
The form had the following property added to it:

`issuer`
The contact information of the office which issued the ID number.

`risk:threat`
The form had the following property added to it:

`mitre:attack:group`
A mapping to a MITRE ATT&CK group if applicable.

`risk:tool:software`
The form had the following property added to it:

`mitre:attack:software`
A mapping to a MITRE ATT&CK software if applicable.

`risk:mitigation`
The form had the following property added to it:

`mitre:attack:mitigation`
A mapping to a MITRE ATT&CK mitigation if applicable.

Deprecated Forms

The following forms have been marked as deprecated:

`risk:hasvuln`
Please use `risk:vulnerable`.

Light Edges

`has`
When used with an `econ:bank:statement` and an `econ:acct:payment`, the edge indicates the bank statement includes the payment.

When used with an `ou:org` node, the edge indicates the organization is or was in possession of the target node.

When used with a `ps:contact` node, the edge indicates the contact is or was in possession of the target node.

When used with a `ps:person` node, the edge indicates the person is or was in possession of the target node.

When used with a `sci:observation` node, the edge indicates the observations are summarized from the target nodes.

When used with an `sci:evidence` node, the edge indicates the evidence includes observations from the target nodes.

`owns`
When used with an `ou:org` node, the edge indicates the organization owns or owned the target node.

When used with a `ps:contact` node, the edge indicates the contact owns or owned the target node.

When used with a `ps:person` node, the edge indicates the person owns or owned the target node.

uses

When used with a `sci:experiment` node, the edge indicates the experiment used the target nodes when it was run.

17.3.3 Features and Enhancements

- Change the compression mode used when streaming Cell backups to speed up the backup process. (#3608)
- When a Cell is mirroring, gracefully go into read-only mode if the leader is a greater version than the mirror. (#3581) (#3631)
- Add `null` as a constant that can be used in Storm expression syntax. (#3600)
- Add `cortex.storm.pool.get`, `cortex.storm.pool.set`, and `cortex.storm.pool.del` commands to manage the Storm query pool which may be used by the Cortex. This replaces the experimental support added in `v2.160.0` for Storm query pool configuration. The experimental Cortex configurations options `storm:pool`, `storm:pool:timeout:sync`, and `storm:pool:timeout:connection` have been removed. (#3602)
- Add `$lib.regex.escape()` API for escaping strings which may be used as regular expression patterns. (#3605)
- Add `View.setMergeComment()` and `View.setMergeVoteComment()` Storm APIs for setting comments on merge requests and merge votes. (#3597)
- Add handlers to the `float`, `int`, and `str` types to handle norming Storm `Number` objects. (#3601)
- Add a new Storm command, `gen.geo.place`, to generate a `geo:place` node by name. (#3620)
- Add an optional reporter name argument to the Storm command `gen.risk.vuln`. (#3628)
- Add a `norm` option to the `$node.difftags()` command. (#3612)
- Add logging around the leader promotion and handoff actions. (#3615)
- Add Telepath APIs to AHA for clearing unused provisioning information. (#3607)

17.3.4 Bugfixes

- Fix a bug where Cortex Cron jobs could start prior to data migrations having completed running. (#3610)
- Fix an issue where `node.prop.set` and `node.prop.del` permissions were not being properly checked. (#3627)
- Fix a bug in the Storm `merge` command where the destination layer was not being properly checked for property set and deletion permissions. (#3627)
- Fix a bug in the Storm `copyto` command where the destination layer was not being properly checked for property set permissions. (#3641)
- Fix an error when granting a role admin permissions on a vault. (#3603)
- Prevent the `synapse.tools.easycert` tool from making certificates with names greater than 64 characters in length. Prevent AHA provisioning from creating provisioning requests which would exceed that length. (#3609)
- Fix an issue with the `velocity` base type returning a float instead of an integer when handling a string value without a unit. (#3616)
- Fix an issue that could occur when pivoting from a secondary property to a form when using variables for the source and target values. (#3618)

- Fix a syntax parsing issue when using the try-set-plus or try-set-minus operator to update an array property on a node using a variable for the property name. (#3630)
- Fix an issue with AHA service pools where their Telepath Clients were not configured for use as `aha://` clients. (#3643)
- Fix an issue with AHA service pools where a fini'd Proxy was not properly cleaned up. (#3645)

17.3.5 Improved Documentation

- Update Storm pivot documentation to add additional examples. (#3599)
- Update the Cortex deployment guide to include a step to configure a Storm query pool. (#3602)

17.3.6 Deprecations

- The tool `synapse.tools.cellauth` has been marked as deprecated and will be removed in `v3.0.0`. (#3587)
- The tool `synapse.tools.cmdr` has been marked as deprecated and will be removed in `v3.0.0`. (#3589)
- The Storm `$lib.model.edge` APIs have been marked as deprecated and will be removed in `v3.0.0`. (#3623)
- The `CoreAPI.enableMigrationMode()` and `CoreAPI.disableMigrationMode()` Telepath methods have been marked as deprecated and will be removed after 2024-05-05. (#3610)
- The Cortex configuration options `cron:enable` and `trigger:enable` have been marked as deprecated and will be removed in `v3.0.0`. These configuration options no longer control cron or trigger behavior. (#3610)
- The Storm Package `synapse_minversion` key has been deprecated and will be removed in `v3.0.0`. Package authors should use the `synapse_version` key to specify a version range for Synapse they support. An example is the string `>=2.165.0,<3.0.0`. (#3593)

17.4 v2.164.0 - 2024-03-01

17.4.1 Features and Enhancements

- Update the Beholder messages `view:merge:init`, `view:merge:prog`, and `view:merge:fini` to add `merge` and `vote` information. (#3580)
- When optimizing Storm lift operations, skip lifts that would be fully filtered out. (#3582)
- Add `tmpdir` information to the `getSystemInfo()` APIs. This is the directory that the service would use for creating any temporary files. (#3583)
- Update the `synapse.tools.modrole` tool to add a `--del` option to delete a role. (#3586)
- Add the `reporter` `ou:org` to `ou:campaign` nodes generated with `gen.ou.campaign` (#3594)
- The `synapse.lib.certdir.CertDir` class has been updated to use the `cryptography` APIs instead of the `PyOpenSSL` APIs where possible. The `CertDir` APIs no longer return `PyOpenSSL` objects, and now return `cryptography` related objects. (#3568)
- Update the `cryptography` and `PyOpenSSL` libraries to require their latest versions. (#3568)

17.4.2 Bugfixes

- Model interfaces now populate properties for the sub-interfaces. (#3582)
- Use `tostr` on property and form names when computing lifts and pivots to avoid a Python `AttributeError` exception. Invalid types will now raise a `StormRuntimeException`. (#3584)

17.4.3 Deprecations

- The tool `synapse.tools.cellauth` has been marked as deprecated and will be removed in `v3.0.0`. (#3587)
- The tool `synapse.tools.cmdr` has been marked as deprecated and will be removed in `v3.0.0`. (#3589)

17.5 v2.163.0 - 2024-02-21

17.5.1 Features and Enhancements

- Add Storm API methods to `$lib.axon` which share the functionality of `$lib.bytes` APIs. These include `$lib.axon.has`, `$lib.axon.hashset`, `$lib.axon.put`, `$lib.axon.size`, and `$lib.axon.upload`. (#3570) (#3576)
- Add support for user provided certificates for doing mTLS in Storm HTTP requests. (#3566)
- Enable constructing a guid in Storm from a single value with `$lib.guid(valu=$item)`. (#3575)

17.6 v2.162.0 - 2024-02-15

17.6.1 Model Changes

- Updates to the `inet`, `infotech`, `ou`, `proj`, and `risk` models. (#3549) (#3551) (#3564)

  New Properties

  `inet:email:message`
  : The form had the following properties added to it:

    `received:from:ipv4`
    : The sending SMTP server IPv4, potentially from the Received: header.

    `received:from:ipv6`
    : The sending SMTP server IPv6, potentially from the Received: header.

    `received:from:fqdn`
    : The sending server FQDN, potentially from the Received: header.

  `ou:oid:type`
  : The form had the following property added to it:

    `url`
    : The official URL of the issuer.

  `proj:project`
  : The form had the following property added to it:

    `type`
    : The project type.

`risk:alert`
The form had the following properties added to it:

`status`
The status of the alert.

`assignee`
The Synapse user who is assigned to investigate the alert.

`ext:assignee`
The alert assignee contact information from an external system.

`risk:mitigation`
The form had the following properties added to it:

`reporter`
The organization reporting on the mitigation.

`reporter:name`
The name of the organization reporting on the mitigation.

`tag`
The tag used to annotate nodes which have the mitigation in place.

New Forms

`proj:project:type:taxonomy`
A type taxonomy for projects.

Deprecated Properties

`it:mitre:attack:group`
The `it:mitre:attack:group` form had the following property marked as deprecated:

- `tag`

`it:mitre:attack:tactic`
The `it:mitre:attack:tactic` form had the following property marked as deprecated:

- `tag`

`it:mitre:attack:technique`
The `it:mitre:attack:technique` form had the following property marked as deprecated:

- `tag`

`it:mitre:attack:software`
The `it:mitre:attack:software` form had the following property marked as deprecated:

- `tag`

`it:mitre:attack:campaign`
The `it:mitre:attack:campaign` form had the following property marked as deprecated:

- `tag`

17.6.2 Features and Enhancements

- Add Storm API methods for inspecting and manipulating dictionary objects in Storm. These are `$lib.dict.has()`, `$lib.dict.keys()`, `$lib.dict.pop()`, `$lib.dict.update()`, and ``$lib.dict.values()` (#3548)
- Add a `json()` method to the `str` type in Storm to deserialize a string as JSON data. (#3555)
- Add an `_ahainfo` attribute to the `Telepath.Proxy`, containing AHA service name information if that is provided to the Dmon. (#3552)
- Add permissions checks to `$lib.bytes` APIs using `axon.has` for APIs that check for information about the Axon or metrics; and `axon.upload` for APIs which put bytes in the Axon. These are checked with `default=True` for backward compatibility. (#3563)
- The rstorm `storm-svc` and `storm-pkg` directives now wait for any `onload` handlers to complete. (#3567)
- Update the Synapse Python package trove classifiers to list the platforms we support using Synapse with. (#3557)

17.6.3 Bugfixes

- Fix a bug in the `Cell.updateHttpSessInfo()` API when the Cell does not have the session in memory. (#3556)
- Fix a bug where a user was allowed to vote for their own View merge request. (#3565)
- Include Storm variables from the current and parent scopes when resolving STIX properties and relationships. (#3571)

17.6.4 Improved Documentation

- Update the Storm automation documentation. Added additional information about permissions used to manage automations. Added examples for `edge:add` and `edge:del` triggers. Added examples for managing Macro permissions. (#3547)
- Update the Storm filtering and lifting documentation to add information about using interfaces and wildcard values with those operations. (#3560)
- Update the Synapse introduction to note that Synapse is not intended to replace big-data or data-lake solutions. (#3553)

17.6.5 Deprecations

- The Storm function `$lib.dict()` has been deprecated, in favor of using the `({"key": "value"})` style syntax for directly declaring a dictionary in Storm. (#3548)
- Writeback layer mirrors and upstream layer mirrors have been marked as deprecated configuration options. (#3562)

17.7 v2.161.0 - 2024-02-06

17.7.1 Features and Enhancements

- Add a Storm command `gen.it.av.scan.result` to help generate `it:av:scan:result` nodes. (#3516)
- Add item specific error message when users do not have sufficient permissions on an object which is using easyperms. (#3532)
- Ensure that Nexus events which are written to the log are always applied and cannot be cancelled while the Nexus handler is running. (#3518)
- Add `getMergeRequest()` and `getMergeRequestSummary()` Storm APIs to the `View` object, in order to get information about View merges via Storm. (#3541)
- Add AHA information to the output of the `Cell.getCellInfo()` API. This includes the service name, leader, and network. (#3519)
- Logs related to AHA service registration and setting services as offline are now logged at the `INFO` level. (#3534)
- When creating Cron jobs and Triggers, record their creation time. (#3521) (#3538)
- Add a `Cell.updateHttpSessInfo()` API to set multiple keys at once on a HTTP session. (#3544)
- Update the allowed versions of the `cbor2` and `` pycryptodome`` libraries. (#3540)

17.7.2 Bugfixes

- The Storm API for creating websockets, `$lib.inet.http.connect()`, did not properly handle the `ssl_verify` argument, causing SSL verification of Websocket requests to default to being disabled. This argument is now handled correctly, with SSL verification being enabled by default. (#3527)
- Fix a bug in embedded Storm queries where they failed to grab their variables properly. (#3531)
- Fix a bad variable reference in the Storm `graph` implementation. (#3531)
- Fix a bug where modifying nodes in a Storm Dmon did not properly update the in-flight node. (#3520)

17.7.3 Improved Documentation

- Update the Cortex admin guide with additional information about removing extended forms and properties. (#3510)
- Update the Data Model documentation to include additional information about extended forms and properties. (#3523)
- Update the Data Model documentation to include information about property interfaces. (#3523)

17.8 v2.160.0 - 2024-01-24

17.8.1 Automatic Migrations

- Update `inet:ipv6` nodes to set their `:type` and `:scope` properties. (#3498)
- Update existing layer push and layer pull configurations to set the default chunk size and queue size values on them. (#3480)
- See *Data Migration* for more information about automatic migrations.

17.8.2 Model Changes

- Updates to the `infotech`, `ou`, and `risk` models. (#3501) (#3504) (#3498)

  New Properties

  `risk:vuln`
  The form had the following properties added to it:

  `severity`
  The severity of the vulnerability.

  `priority`
  The priority of the vulnerability.

  `inet:ipv6`
  The form had the following properties added to it:

  `type`
  The type of IP address (e.g., private, multicast, etc.).

  `scope`
  The IPv6 scope of the address (e.g., global, link-local, etc.).

  Updated Types

  `it:exec:proc`
  This now inherits the `it:host:activity` interface.

  `it:exec:thread`
  This now inherits the `it:host:activity` interface.

  `it:exec:loadlib`
  This now inherits the `it:host:activity` interface.

  `it:exec:mmap`
  This now inherits the `it:host:activity` interface.

  `it:exec:mutex`
  This now inherits the `it:host:activity` interface.

  `it:exec:pipe`
  This now inherits the `it:host:activity` interface.

  `it:exec:url`
  This now inherits the `it:host:activity` interface.

  `it:exec:bind`
  This now inherits the `it:host:activity` interface.

`it:exec:file:add`
: This now inherits the `it:host:activity` interface.

`it:exec:file:read`
: This now inherits the `it:host:activity` interface.

`it:exec:file:write`
: This now inherits the `it:host:activity` interface.

`it:exec:file:del`
: This now inherits the `it:host:activity` interface.

`it:exec:reg:get`
: This now inherits the `it:host:activity` interface.

`it:exec:reg:set`
: This now inherits the `it:host:activity` interface.

`it:exec:reg:del`
: This now inherits the `it:host:activity` interface.

17.8.3 Features and Enhancements

- Add tab completion of commands, forms, properties, tags, and `$lib.` functions the Storm CLI tool. (#3493) (#3507)
- Add `node.set.<form>.<prop>` and `node.del.<form>.<prop>` permissions conventions to the Cortex for property sets and deletes. (#3505)
- Add experimental support for Storm query offloading to the Cortex. This can be used to offload Storm queries to an AHA service pool. This can be configured with the `storm:pool` option on the Cortex. (#3452) (#3513)
- Add a `--deledges` option to the `delnode` command. This deletes the N2 edges for a node before deleting the node. (#3503)
- When creating layer push or pull configurations, the chunk size and queue size can now be set. (#3480)
- Add a `cell.hasHttpSess()` API to check if a given Cell has a known HTTP session. (#3485)
- Fire a `core:pkg:onload:complete` event when a Storm package `onload` handler is completed. This can be used when writing unit tests for Rapid Power-ups. (#3497)

17.8.4 Bugfixes

- Remove dataname index entries when removing all nodedata from a node. (#3499)
- Fix an issue with `tagprops` not being correctly returned in `$node.getByLayer()`. (#3500)
- Fix an issue with the `edges.del` command when using the `--n2` option. This now behaves correctly when the N1 node does not exist. (#3506)
- Fix an issue with duplicate properties being tracked in the property type map of the data model. This could have resulted in multiple nodes being lifted with interface properties. (#3512)

17.8.5 Improved Documentation

- Update Storm filter documentation. Additional information about tag globbing and interval filtering has been included. (#3489)

17.9 v2.159.0 - 2024-01-16

17.9.1 Automatic Migrations

- Update any extended model elements which used the `taxonomy` interface to now use the `meta:taxonomy` interface. (#3334)
- See *Data Migration* for more information about automatic migrations.

17.9.2 Features and Enhancements

- Add support for lifting, pivoting, and filtering using wildcards, lists, variables, and interfaces as form and property names. (#3334)
- Migrate the name of the `taxonomy` interface to `meta:taxonomy`. (#3334)
- Update the pinned version of the `lark` library to `1.1.9` for compatibility with Python 3.11.7. (#3488)

17.9.3 Bugfixes

- Prevent re-adding extended model elements in Nexus handlers. (#3486)
- Add missing permissions checks on the `$lib.axon.urlfile()` API. This now requires the `node.add.file:bytes` and `node.add.inet:urlfile` permissions. (#3490)
- Fix the permission checking for Vaults to check the Storm runtime `asroot` status. (#3492)
- Fix an issue with `$lib.stix.import.ingest()` not converting `bundle` to a dictionary. (#3495)

17.9.4 Improved Documentation

- Add documentation for the `reverse` keyword. (#3487)
- Clarify the use of the "try" operator (`+?`) in edit operations. (#3482) (#3487)
- Update Storm lift documentation to add additional examples and clarify existing documentation. (#3487)
- Update Storm data modification documentation to add additional examples and clarify existing documentation. (#3482)

17.10 v2.158.0 - 2024-01-03

17.10.1 Features and Enhancements

- Update the allowed versions of the``fastjsonschema``, `idna`, `pygments`, and `aiosmtplib` libraries. (#3478)

17.10.2 Bugfixes

- Fix a bug where the `role:add` and `user:add` Nexus handlers could raise an exception when being called by a service mirror. (#3483)

17.10.3 Improved Documentation

- Update the Storm command reference guide. (#3481)
- Update the Synapse glossary. (#3481)

17.11 v2.157.0 - 2023-12-21

17.11.1 Features and Enhancements

- Added vaults feature for storing and sharing secret values (such as API keys) and associated configuration settings. Vaults can be shared with and used by another user without them being able to see the enclosed secret values. (#3319) (#3461)
- Added Storm commands to interact with vaults: `vaults.*`. (#3319)
- Added Storm library to interact with vaults: `$lib.vaults.*`. (#3319)
- Add merge request voting and history tracking for full View merges. (#3466) (#3473) (#3475)
- Add service pooling support to AHA. This allows for dynamic service topologies and distributed Telepath API calls. (#3353) (#3477)
- Add user managed API keys that can be used to access HTTP API endpoints. (#3470)
- Added an `--optsfile` option to the Storm CLI tool. This can be used to specify opts to the CLI tool via YAML. See *Storm Opts* for details about available options. (#3468)
- Cron status changes are now persisted through the Nexus. (#3460)
- Add a `show:storage` option to the Storm runtime opts to include the storage node data in the `node` message. (#3471)

17.11.2 Bugfixes

- Log a warning message when calling the Python `User.pack(packroles=True)` method when a user role is missing from the Auth subsystem. A missing role previously caused an `AttributeError` exception. (#3469)
- Ensure the Nexus `view:detach` event is idempotent. (#3474)
- Fix an issue where Storm subqueries containing non-runtsafe values could potentially not execute. (#3443)

17.12 v2.156.0 - 2023-12-08

17.12.1 Model Changes

- Updates to the `infotech`, `ou`, and `risk` models. (#3436) (#3438) (#3446) (#3447)

  New Properties

  `it:av:scan:result`
  The form had the following properties added to it:

  `target:ipv4`
  The IPv4 address that was scanned to produce the result.

  `target:ipv6`
  The IPv6 address that was scanned to produce the result.

  `ou:campaign`
  The form had the following property added to it:

  `mitre:attack:campaign`
  A mapping to a Mitre ATT&CK campaign if applicable.

  `risk:vuln`
  The form had the following property added to it:

  `id`
  An identifier for the vulnerability.

  New Forms

  `it:mitre:attack:campaign`
  A Mitre ATT&CK Campaign ID.

  `risk:technique:masquerade`
  Represents the assessment that a node is designed to resemble another in order to mislead.

  Updated Types

  `it:os:windows:sid`
  The regular expression used to validate the SID has been updated to allow modeling well-known SID values.

17.12.2 Features and Enhancements

- Add an `empty` keyword to Storm to conditionally execute queries when there are no nodes in the pipeline. (#3434)
- Add Storm APIs for getting property counts for a given `layer` or `view`.. These APIs are `getPropCount()`, `getPropArrayCount()`, `getTagPropCount()`. (#3435)
- Add a new permission, `view.fork`, which can be used to control access for forking a view. This permission defaults to being allowed. (#3437)
- Add Storm operators to allow pivoting and joining across light edges. The following examples show pivoting across `refs` edges and joining the destination nodes with the inbound nodes: `-(refs)+>` and `<+(refs)-`. (#3441)
- Add Storm operators to do pivot out and join (`--+>`) and pivot in and join (`<+--`) operations across light edges. (#3441) (#3442)
- Storm subqueries used to assign a value now always run. (#3445)
- Non-runtsafe `try...catch` blocks in Storm now run when there are no inbound nodes. (#3445)
- The Storm API `$lib.storm.eval()` now logs its `text` argument to the `synapse.storm` logger. (#3448)
- Add a `--by-name` argument to the Storm `stats.countby` command. This can be used to sort the results by name instead of count. (#3450)
- Add a new Storm API `$lib.gis.bbox()` to allow computing geospatial bounding boxes. (#3455)

17.12.3 Bugfixes

- Prevent recursion errors in `inet:fqdn` onset handlers. (#3433)
- When dereferencing a list or dictionary object off of a Node in Storm, the returned value is now a copy of the value. This avoids the situation where modifying the deferenced value appeared to alter the node but did not actually result in any edits to the underlying data. (#3439)
- Add a missing sub-query example to Storm `for` loop documentation. (#3451)
- Fix an issue where attempting to norm an IPv4 with an invalid netmask would raise a Python error. (#3459)

17.12.4 Deprecations

- Deprecated Cortex and splice related APIs which were marked for removal after 2023-10-01 have been removed. The list of these APIs can be found at *API Deprecation Notice - 2023-10-01*. These additional splice related changes have also been made:

  The HTTP API `/api/v1/storm` now sets the default `editformat` opt value to `nodeedits`. Previously this API produced splice changes by default.

  The `synapse.tools.cmdr storm` command no longer displays splices.

  The `synapse.tools.cmdr log` command no longer records splices.

  The `synapse.tools.csvtool` tool no longer records or displays splices.

  The `synapse.tools.feed` tool no longer supports splices or nodeedits as input and the splice documentation example has been removed.

  (#3449)
- The deprecated function `synapse.common.aclosing()` has been removed. (#3449)

- Provisioning a Synapse service with AHA now always updates the local CA certificate and generates new host and user certificates for the service. Previously these would not be regenerated if the CA or service names did not change. (#3457)

17.13 v2.155.0 - 2023-11-17

17.13.1 Model Changes

- Updates to the `infotech`, `proj`, and `risk` models. (#3422)

  New Properties

  `proj:ticket`
  : The form had the following property added to it:

    `ext:assignee`
    : Ticket assignee contact information from an external system.

  `risk:alert`
  : The form had the following property added to it:

    `severity`
    : A severity rank for the alert.

  `it:exec:query`
  : The form had the following property added to it:

    `offset`
    : The offset of the last record consumed from the query.

  New Forms

  `it:av:scan:result`
  : The result of running an antivirus scanner.

  Updated Properties

  `risk:alert`
  : The form had the following properties updated on it:

    `priority`
    : The type of this property has been changed from an `int` to `meta:priority`.

  `risk:attack`
  : The form had the following properties updated on it:

    `severity`
    : The type of this property has been changed from an `int` to `meta:severity`.

  `risk:compromise`
  : The form had the following properties updated on it:

    `severity`
    : The type of this property has been changed from an `int` to `meta:severity`.

  Deprecated Forms

  The following forms have been marked as deprecated:

  `it:av:sig`
  : Please use `it:av:scan:result`.

it:av:filehit
Please use `it:av:scan:result`.

it:av:prochit
Please use `it:av:scan:result`.

17.13.2 Features and Enhancements

- Add a `detach()` method to the Storm `view` object. This will detach a forked View from its parent. (#3423)
- Change the method used to generate the `took` value in the Storm `fini` message to use a monotonic clock. (#3425)
- Performing an invalid "pivot in" operation with a form target (`<- some:form`) now raises a `StormRuntimeError` instead of silently doing nothing. (#3426)
- Allow relative properties on the right hand side of a filter operation when using Storm expression syntax. (#3424)
- Add an `/api/v1/logout` method on the Cell to allow HTTPS users to logout of their sessions. (#3430)
- Allow taxonomy prefix lift and filter operations to work with taxon parts. (#3429)
- Update the allowed versions of the `cbor2`, `pycryptodome`, `pygments`, `vcrpy`, and `xxhash` libraries. Update the pinned version of the `lark` library. (#3418)

17.13.3 Bugfixes

- Fix a performance regression in graph projection for computing large graphs in Storm. (#3375)
- Fix a conflict between Storm `$lib.inet.http` functions and `vcrpy` where `json` and `data` args shouldn't be passed together. (#3428)

17.13.4 Improved Documentation

- Fix an error in the Cortex mirror deployment guide. The example `docker-compose.yaml` was missing the environment variables for `SYN_CORTEX_AXON` and `SYN_CORTEX_JSONSTOR`. (#3430)

17.14 v2.154.1 - 2023-11-15

This release is for updating the version of the `cryptography` package in Synapse containers to `41.0.5`.

17.15 v2.154.0 - 2023-11-15

17.15.1 Automatic Migrations

- Update the `inet:ipv4:type` value for RFC6598 addresses to `shared`. (#3410)
- See *Data Migration* for more information about automatic migrations.

17.15.2 Model Changes

- Update to the `inet` and `ou` models.

  (#3406) (#3407) (#3410) (#3416)

  Updated Types

  `inet:ipv4`
  : RFC6598 addresses now have a `:type` property value of `shared`.

  `inet:url`
  : Accept Microsoft URLPrefix strings with a strong wildcard host value.

    Add a check to prevent creating `inet:url` nodes with an empty host and path part, such as `inet:url=file://''`.

  New Properties

  `ou:org`
  : The form had the following property added to it:

    `tag`
    : A base tag used to encode assessments made by the organization.

  `risk:compromise`
  : The form had the following properties added to it:

    `ext:id`
    : An external unique ID for the compromise.

    `url`
    : A URL which documents the compromise.

  `risk:alert`
  : The form had the following property added to it:

    `host`
    : The host which generated the alert.

  New Forms

  `ou:requirement`
  : A specific requirement.

  `risk:leak`
  : An event where information was disclosed without permission.

  `risk:leak:type:taxonomy`
  : A taxonomy of leak event types

  `risk:extortion`
  : An event where an attacker attempted to extort a victim.

  `risk:extortion:type:taxonomy`
  : A taxonomy of extortion event types.

  Light Edges

  `leaked`
  : When used with a `risk:leak` node, the edge indicates the leak included the disclosure of the target node.

  `leveraged`
  : When used with a `risk:extortion` node, the edge indicates the extortion event was based on attacker access to the target node.

meets
When used with a `ou:requirement` node, the edge indicates the requirement was met by the source node.

17.15.3 Features and Enhancements

- Add `edge:add` and `edge:del` as trigger conditions. These trigger when light edges are added or removed from a node. (#3389)
- Storm lift and filter operations using regular expressions (~=) are now case insensitive by default. (#3403)
- Add a `unique()` method to the Storm `list` object. This returns a new list with only unique elements in it. (#3415)
- Add support for `synapse.tools.autodoc` to generate documentation for API definitions declared in Storm packages. (#3382)
- A review of Storm library functions was performed and all `readonly` safe functions have been marked for execution in a `readonly` Storm runtime. (#3402)
- Allow setting the layers on a root View with forks. (#3413)

17.15.4 Bugfixes

- Per-node Storm variables are now passed into subquery assignment expressions. (#3405)
- Fix an issue with Storm Dmon hive storage being opened too late in the Cortex startup sequence. (#3411)
- Remove a check when deleting tags from a node which prevented tag deletion from a node when the root tag was deleted in a parent view. (#3408)

17.16 v2.153.0 - 2023-10-27

17.16.1 Model Changes

- Update to the `inet` and `ou` models.

  (#3393) (#3396)

  Deprecated Properties

  inet:web:acct
  The `inet:web:acct` form had the following properties marked as deprecated:

  - `name:en`
  - `realname:en`

  inet:web:group
  The `inet:web:group` form had the following property marked as deprecated:

  - `name:en`

  ou:industry
  The `ou:industry` form had the following property marked as deprecated:

  - `subs`

17.16.2 Features and Enhancements

- Add a new Storm API, `$lib.cortex.httpapi`, for creating and managing Extended HTTP API endpoints. These Cortex HTTP API endpoints allow a user to create custom responses via Storm. Documentation for this feature can be found at *Extended HTTP API*. (#3366)
- Add a new Storm API, `$lib.iters.zip()`, to iterate over sequences of items together. (#3392) (#3398)
- Add a Storm command `stats.countby` to tally occurrences of values and display a barchart representing the values. (#3385)
- Update the Storm command `auth.user.mod` to allow setting a user as admin on a specific auth gate. (#3391)
- The `proxy` argument to `$lib.inet.http.*`, `$lib.axon.wget()`, `$lib.axon.urlfile()`, and `$lib.axon.wput()` APIs is now gated behind the permission `storm.lib.inet.http.proxy`. Previously this required admin permission to utilize. (#3397)
- Add an `errors` parameter to `$lib.axon.readlines()`, `$lib.axon.csvrows()`, and `$lib.axon.jsonlines()`. This parameter defaults to `ignore` to ignore any decoding errors that are encountered when decoding text. (#3395)
- Lower the maximum allowed version of the `pyopenssl` library. (#3399)

17.16.3 Bugfixes

- Fix a bug in the `Cortex.syncLayersEvents()` and `Cortex.syncIndexEvents()` APIs which caused layers to stop sending their node edits under certain conditions. (#3394)
- Storm now raises a `BadSyntaxError` when attempting to filter by wildcard tags or tagprops when a value is specified for the filter. (#3373)

17.17 v2.152.0 - 2023-10-17

17.17.1 Model Changes

- Update to the `biz`, `crypto`, `geo`, `it`, `mat`, `media`, and `risk` models.

  (#3341) (#3377) (#3376) (#3381)

  Updated Interfaces

  `crypto:smart:effect`
  : Add a `doc` value to the interface.

  `it:host:activity`
  : Add a `doc` value to the interface.

  `taxonomy`
  : Add a `doc` value to the interface.

  Updated Types

  `time`
  : The `time` type now recognizes RFC822 formatted time strings.

  `biz:service:type:taxonomy`
  : The `taxonomy` interface has been added to the type.

geo:place:taxonomy
The taxonomy interface has been added to the type.

it:log:event:type:taxonomy
The taxonomy interface has been added to the type.

it:prod:soft:taxonomy
The taxonomy interface has been added to the type.

mat:type
The taxonomy interface has been added to the type.

media:news:taxonomy
The taxonomy interface has been added to the type.

risk:alert:taxonomy
The taxonomy interface has been added to the type.

risk:alert:verdict:taxonomy
The taxonomy interface has been added to the type.

risk:threat:type:taxonomy
The taxonomy interface has been added to the type.

New Forms

it:dev:repo:label
A developer selected label.

it:dev:repo:issue:label
A label applied to a repository issue.

17.17.2 Features and Enhancements

- Update the Storm string repr for `$lib.null` and `$lib.undef` values to `$lib.null` and `$lib.undef`. Previously these printed `None` and an opaque Python object repr. (#3361)
- The `synapse.tools.aha.list` CLI tool now checks if it is connected to an Aha server prior to enumerating Aha services. (#3371)

17.17.3 Bugfixes

- Update the `file:path` support for scrape related APIs to address an issue when matching against Linux style paths. (#3378)
- Update the `hex` type to `zeropad` strings prior to checking their validity. (#3387)
- Update the `yaml.CSafeLoader` check to not require the class to be available. (#3386)

17.17.4 Improved Documentation

- Update the documentation for the Storm `view.exec` command to explain the separation of events and nodes between the parent and sub-runtimes. (#3379)

17.18 v2.151.0 - 2023-10-06

17.18.1 Model Changes

- Update to the `it` model. (#3361)

  New Forms

  `it:mitre:attack:flow`
  A MITRE ATT&CK Flow diagram.

17.18.2 Features and Enhancements

- Add a new Storm library `$lib.infosec.mitre.attack.flow`. This can be used to normalize and create `it:mitre:attack:flow` nodes from MITRE ATT&CK Flow Diagrams. (#3361) (#3372)
- Update the Storm `note.add` command to set the `meta:note:created` property on the note. (#3569)
- Add the Axon HTTP APIs to the Cortex. These API endpoints use the Axon that the Cortex is configured to use. (#3550)
- Allow user defined functions in Storm to execute in a `readonly` Storm runtime. (#3552)
- Clarify the Nexus `IsReadOnly` exception to include the common cause for the error, which is normally insufficent space on disk. (#3359)
- Add a `SYN_LOG_DATEFORMAT` environment variable to allow specifying custom timestamp formats for Synapse services. (#3362)
- Add a `status` attribute to structured log events for user and role related log events. This attribute indicates if the event was a `CREATE`, `DELETE`, or `MODIFY` operation. (#3363)
- Update `Cell.getLogExtra()` to prefer using the `user` key from the task scope before using the `sess` key from the task scope. Cortex APIs which execute Storm queries now set the `user` scope to the user the query is running as. This increases the accuracy of log events caused by Storm queries when the `user` is specified in the `opts`. (#3356)
- Update Storm setitem AST operator to check the readonly flag on functions when operating in a `readonly` Storm runtime. (#3364)
- Update the minimum required version of the `fastjsonschema` library. (#3358)
- Update tests and remove the use of deprecated functions for improved Python 3.12 compatibility. (#3355) (#3567)

17.18.3 Bugfixes

- Fixed a bug when parenting a View to another View where the bottom view has more than one layer in it omitted non-write layers. The set of layers is now properly computed. (#3354)

17.18.4 Improved Documentation

- Update the list of Cortex permissions in the Admin Guide. (#3331)
- The Form documentation has been updated to project the secondary properties and associated light edges as tables. (#3348)

17.19 v2.150.0 - 2023-09-22

17.19.1 Model Changes

- Updates to the `inet` model. (#3347)

  Updated Types

  `inet:url`
  The `inet:url` type now recognizes UNC network paths and converts them into `smb://` URLs.

17.19.2 Features and Enhancements

- Allow Storm trigger APIs to reference triggers from other views. (#3342)
- Update the `synapse.lib.scrape` and associated APIs to capture additional data: (#3223) (#3347)

  `it:sec:cpe`
  CPE 2.3 strings are now identified.

  `inet:url`
  UNC based paths are now identified.

- Update the `synapse.lib.scrape` and associated APIs to use subprocesses when scraping large volumes of text. (#3344)
- Add additional logging for HTTP API endpoints when a request has invalid login information. (#3345)
- The CryoTank service has had permissions added to it. (#3328)

17.19.3 Bugfixes

- Stormtypes `stor` functions were not previously checked during `readonly` runtime execution. These are now validated and `stor` functions which would result in changing data in the Cortex will now raise an exception when used with a `readonly` Storm runtime. (#3349)

17.19.4 Improved Documentation

- Update the list of Cortex permissions in the Admin Guide. (#3331)
- The Form documentation has been updated to project the secondary properties and associated light edges as tables. (#3348)

17.20 v2.149.0 - 2023-09-14

17.20.1 Model Changes

- Updates to the `it`, `meta`, and `ou` models. (#3338)

  New Properties

  `taxonomy`
  : The interface had the following property added to it:

    `description`
    : A definition of the taxonomy entry.

  `inet:email:message`
  : The form had the following property added to it:

    `cc`
    : Email addresses parsed from the "cc" header.

  `meta:source`
  : The form had the following property added to it:

    `url`
    : A URL which documents the meta source.

  `ou:campaign`
  : The form had the following property added to it:

    `timeline`
    : A timeline of significant events related to the campaign.

  Deprecated Properties

  `taxonomy`
  : The `taxonomy` interface had the following property marked as deprecated:

    - `summary`

17.20.2 Features and Enhancements

- Add best-effort support to scrape APIs to identify Windows and Linux file paths. (#3343)
- Update the Storm `view.add` command to add a `--worldreadable` flag to create a view which is readable by the `all` role. The `$lib.view.add()` Storm API now also accepts an optional `worldreadable` argument as well. (#3333)
- Update the Storm `note.add` command to add a `--yield` flag which yields the newly created note. (#3337)
- Add Storm commands `gen.ou.id.number` and `gen.ou.id.type` to help generate `ou:id:number` and `ou:id:type` nodes. (#3339)
- Support dynamically setting a Layer to `readonly` using the Storm `$layer.set()` API. (#3332)

- Update the Storm command `help` to display information about Storm types, Storm Libraries and functions. (#3335)

17.20.3 Bugfixes

- Ensure that the Cell `tmp` directory is on the same volume as the Cell storage directory prior to attempting to run the onboot optimization process. If the volumes are different this now issues a warning message and skips the optimization process. (#3336)
- Protect the Cortex Cron scheduling loop from errors that could happen when starting an agenda item. (#3340)

17.21 v2.148.0 - 2023-09-05

17.21.1 Features and Enhancements

- Add a `$lib.jsonstor.cachedel()` API to allow for the removal of data created by `$lib.jsonstor.cacheget()`. (#3322)

17.21.2 Bugfixes

- Ensure the base Cell `fini()`'s the Aha client that it creates. This fixes a unit test performance issue. (#3324)

17.21.3 Deprecations

- Mark the following Cryotank related API arguments and functions as deprecated. These APIs are related to server-side offset tracking for callers. Code which relies on these should be updated to do local offset tracking. These APIs and arguments will be removed in v2.150.0. (#3326)
  - `CryoApi.puts(seqn=...)` argument.
  - `CryoApi.rows(seqn=...)` argument.
  - `CryoApi.slice(iden=...)` argument.
  - `CryoApi.offset()` function.
  - `CryoTank.getOffset()` function.
  - `CryoTank.setOffset()` function.
  - `CryoTank.puts(seqn=...)` argument.
  - `CryoTank.rows(seqn=...)` argument.
  - `CryoTank.slice(iden=...)` argument.
  - `TankAPI.offset()` function.
  - `TankApi.puts(seqn=...)` argument.
  - `TankAPI.slice(iden=...)` argument.

17.22 v2.147.0 - 2023-08-31

17.22.1 Features and Enhancements

- Add `wait` and `timeout` arguments to Cryotank `slice()` APIs. (#3320)
- Add a `charset` parameter to the Storm `inet:imap:server.search()` API. This can be used to specify the `CHARSET` value when crafting a search query. (#3318)

17.22.2 Bugfixes

- Vendor the `asyncio.timeouts.Timeout` class from Python 3.11.3 to ensure correct task cancellation behavior is available for `synapse.common.wait_for()`. (#3321)

17.23 v2.146.0 - 2023-08-29

17.23.1 Features and Enhancements

- Update Storm `graph` projection to only include edges between nodes in the result set and include a *"reverse": true* in the edge info when embedding an edge on its target node once it is yielded. (#3305)
- Map the Nexus LMDB slab with `map_async=True` by default. (#3314)
- Mark the Storm `macro.exec` as a `readonly` safe command. Mark the Storm APIs `$lib.macro.list()` and `$lib.macro.get()` as `readonly` safe. Mark the `str` APIs as `readonly` safe. (#3316)

17.23.2 Bugfixes

- Fix an issue where Layer data migrations failed when a layer was marked as `readonly`. (#3313)
- Fix an issue where utility functions for packed nodes in `synapse.lib.node` did not handle nodes from HTTP API endpoints. (#3315)

17.24 v2.145.0 - 2023-08-25

17.24.1 Automatic Migrations

- Update indexing for light edges to index the N1 and N2 node identifiers together. (#3302)
- See *Data Migration* for more information about automatic migrations.

17.24.2 Model Changes

- Update to the `inet`, `it`, and `meta` models. (#3285) (#3298) (#3301) (#3310)

  New Types

  `it:sec:tlp`
  : The US CISA Traffic-Light-Protocol used to designate information sharing boundaries.

  `meta:priority`
  : A generic priority enumeration.

  `meta:severity`
  : A generic severity enumeration.

  New Forms

  `it:sec:metrics`
  : A node used to track metrics of an organization's infosec program.

  `it:sec:vuln:scan`
  : An instance of running a vulnerability scan.

  `it:sec:vuln:scan:result`
  : A vulnerability scan result for an asset.``

  New Properties

  `it:dev:repo:issue`
  : The form had the following properties added to it:

    `updated`
    : The time the issue was updated.

    `id`
    : The ID of the issue in the repository system.

  `it:dev:repo:issue:comment`
  : The form had the following properties added to it:

    `created`
    : The time the comment was created.

    `updated`
    : The time the comment was updated.

  `it:dev:repo:diff:comment`
  : The form had the following properties added to it:

    `created`
    : The time the comment was created.

    `updated`
    : The time the comment was updated.

  `meta:note`
  : The form had the following properties added to it:

    `updated`
    : The time the note was updated.

  Deprecated Properties

  `it:exec:proc`
  : The `it:exec:proc` form had the following property marked as deprecated:

- src:exe

inet:whois:iprec
The inet:whois:iprec form had the following property marked as deprecated:

- registrant

17.24.3 Features and Enhancements

- Add a new Storm keyword, reverse(...), which can be used to run a lift operation in reverse order. (#3266)
- Update indexing for light edges to index the N1 and N2 node identifiers together. (#3302)
- Update the Storm once command behavior and documentation to be more intuitive when setting its timestamp and allowing nodes through it. (#3282)
- Add a synapse_version key to the Storm Package schema. This can be used to provide a string version identifier with a minimum and maximum version, such as >=2.145.0,<3.0.0. (#3304)
- Update the Storm runtime to respect permissions declared with a default value of true. This allows Storm packages to define permissions which are defaulted to true. (#3287)
- Add a SIGHUP handler to the base Cell which can be used to reload HTTPS certificate files from disk. The synapse.tools.reload tool can also be used to trigger this behavior. (#3293)
- The optional max:users feature no longer counts locked or archived users when adding users. (#3295)
- Update the YAML functions to use the yaml.CSafeLoader and yaml.CSafeDumper. (#3289)

17.24.4 Bugfixes

- Replace asyncio.wait_for() use with a copy of the Python 3.12 implementation to avoid a race condition when cancelling tasks. (#3299) (#3307)
- Fix an issue with the Storm trigger set() method not properly checking the values that it allows to be set. (#3290)
- Fix an off-by-one bug in the SlabSeqn.aiter() method. (#3300)
- Fix a performance issue with the IPv6 regular expression used in the scrape APIs. (#3311)

17.24.5 Improved Documentation

- Revise the Storm User Guide to consolidate the background information and data modeling sections. Add a user focused section on Views and Layers. (#3303)
- Add int type specific information to the Storm documentation. (#3288)
- The Storm movetag command now moves the doc:url property from the old syn:tag node to the new syn:tag node. (#3294)
- Storm Library and Type documentation no longer renders function signatures with Python style defaults. (#3296)

17.24.6 Deprecations

- Many deprecated Cortex and splice related APIs have been marked for removal after 2023-10-01. The full list of APIs which will be removed can be found at *API Deprecation Notice - 2023-10-01*. (#3292)
- The use of `synapse.common.aclosing()` has been replaced with `contextlib.aclosing()`. The vendored `aclosing()` implementation will be removed in `v2.250.0`. (#3206)

17.25 v2.144.0 - 2023-08-09

17.25.1 Model Changes

- Updates to the `inet:dns` and `it` model. (#3257) (#3276)

  New Forms

  `it:dev:repo:type:taxonomy`
  A version control system type taxonomy.

  `it:dev:repo`
  A version control system instance.

  `it:dev:repo:remote`
  A remote repo that is tracked for changes/branches/etc.

  `it:dev:repo:branch`
  A branch in a version control system instance.

  `it:dev:repo:commit`
  A commit to a repository.

  `it:dev:repo:diff`
  A diff of a file being applied in a single commit.

  `it:dev:repo:issue`
  An issue raised in a repository.

  `it:dev:repo:issue:comment`
  A comment on an issue in a repository.

  `it:dev:repo:diff:comment`
  A comment on a diff in a repository.

  New Properties

  `inet:dns:answer`
  The form had the following properties added to it:

  `time`
  The time that the DNS response was transmitted.

17.25.2 Features and Enhancements

- The iden of the Cron job is now added to the Storm query log made with the `synapse.storm` logger when using structured logging. (#3235)
- Add a `keepalive` option to the Storm query `opts`. This may be used with long-running Storm queries when behind a network proxy or load balancer which may terminate idle connections. (#3272)
- Update the allowed versions of the `cryptography` library. (#3281)

17.25.3 Bugfixes

- Fix an issue where Storm Dmons could start prior to data model migrations. (#3279)
- Adjust the storage convention for `once` state data to fix an edge case and clarify documentation. (#3282)
- Fix an issue with missing keys in storage nodes during migrations. (#3284)

17.26 v2.143.0 - 2023-07-28

17.26.1 Model Changes

- Update to the `crypto` model. (#3256)

  Updated Types

  `hex`
  : The `zeropad` option has been changed from a `bool` to an `int`. It may now be used to specify the zero extended length of the hex string.

  Updated Properties

  `crypto:x509:cert`
  : The form had the following properties updated on it:

    `serial`
    : The `size` value has been changed to `zeropad` to zeropad values with less than 40 octets, and to allow storing large serial numbers from malformed certificates.

17.26.2 Features and Enhancements

- Add `$lib.model.ext.getExtModel()` and `$lib.model.ext.addExtModel()` Storm APIs to get all the extended model definitions in a Cortex and to add extended model definitions to a Cortex in bulk. (#3252)
- Add `inet:ipv6` to the list of types identified with scrape APIs. The `inet:server` form identified by scrape APIs now also identifies IPv6 server addresses. (#3259)
- Add a check to the Cortex startup to identify and log the presence of deprecated model elements and direct users to check and lock them at *model.deprecated.check*. (#3253) (#3264)
- Add a new Storm function, `$lib.vars.type()`, to get the type value of an object. (#3100)
- Add a Storm library, `$lib.pack`, for packing and unpacking structured byte values. (#3261)
- The Storm `$lib.gen()` functions and associated commands now generate stable guid values based on their inputs when making nodes. (#3268)
- Add the `.bazar` TLD to the list of TLDs identified by the Synapse scrape functionality. (#3271)

- Add the View iden to the task identifier for running Storm tasks. (#3247)
- Add performance related sysctl values to the output of the Storm `Cell.getSystemInfo()` and `$lib.cell.getSystemInfo()` APIs. (#3236)
- Update the allowed versions of the `vcrpy` library. Thank you `captainGeech42` for the contribution. (#3204)

17.26.3 Bugfixes

- Ensure the input to the `CoreAPI.storm()` (and related APIs) is a string. (#3255) (#3269)
- Fix a bug in `synapse.tools.aha.enroll` where a user with a `telepath.yaml` file containing an `aha:servers` key with a list of lists failed to enroll a local user. (#3260)
- Fix an issue where Storm functions using `emit` failed to cleanup their sub-runtimes. (#3250)
- Add verification that a Storm function call is being made on a callable object and raise a `StormRuntimeError` if the object cannot be called. Previously invalid calls could raise a `TypeError`. (#3243)
- Fix the order of the Beholder `cron:stop` message firing when a Cron job is stopped. (#3265)

17.26.4 Improved Documentation

- Add a section to the Storm reference for user defined functions in Storm. That can be found at *Storm Reference - Advanced - Functions*. (#3245)
- Update the devops documentation to add a note about the Telepath `aha://` protocol using a `mirror=true` parameter to connect to a service mirror instead of a leader. (#3267)
- Update the `preboot.sh` example script to account for Docker changes introduced in `v2.133.0`.

17.27 v2.142.2 - 2023-07-19

17.27.1 Bugfixes

- Fix an issue which caused the Docker image tags for `vertexproject/synapse-cryotank:v2.141.1`, `vertexproject/synapse-jsonstor:v2.141.1`, and `vertexproject/synapse-stemcell:v2.141.1`, to refer to same image. (#3249)

17.28 v2.142.1 - 2023-07-19

17.28.1 Bugfixes

- Fix an issue which prevented the publication of the Synapse containers with `v2.x.x` tags. (#3248)

17.29 v2.142.0 - 2023-07-19

17.29.1 Automatic Migrations

- Renormalize the `risk:vuln:cvss:v2` and `risk:vuln:cvss:v3` properties. (#3224)
- Migrate the `risk:vuln:name` type from a `str` to a `risk:vulnname` form. (#3227)
- See *Data Migration* for more information about automatic migrations.

17.29.2 Model Changes

- Update to the `it`, `ou`, and `risk` models. (#3224) (#3227) (#3237)

  New Forms

  `risk:vulnname`
  Add a form to capture vulnerability name such as log4j or rowhammer.

  Updated Types

  `hex`
  The `hex` base type now accepts a `zeropad` option that can be used to zero-extend a hex string during normalization.

  `cvss:v2`
  The type now accepts and normalizes unordered CVSS vectors.

  `cvss:v3`
  The type now accepts and normalizes unordered CVSS vectors.

  New Properties

  `it:sec:c2:config`
  The form had the following properties added to it:

  `decoys`
  An array of URLs used as decoy connections to obfuscate the C2 servers.

  `ou:technique`
  The form had the following properties added to it:

  `reporter`
  The organization reporting on the technique.

  `reporter:name`
  The name of the organization reporting on the technique.

  `risk:vuln`
  The form had the following properties added to it:

  `names`
  An array of alternate names for the vulnerability.

17.29.3 Features and Enhancements

- Always convert dictionary keys to their primitive values when working with dictionary objects in Storm. Dictionary objects can no longer have keys set which are mutable objects, such as Nodes. (#3233)
- Add support for octal constants, such as `0o755`, in Storm expressions. (#3231)
- Add additional events to the Behold API message stream for the addition and removal of extended model elements. (#3228)
- Update the `$lib.dmon.add()` variable capture to record variables from embedded query objects. (#3230)
- Add a `.title()` method on Storm strings to get title case formatted strings. (#3242)
- Add a general purpose process pool using forked workers in order to speed up certain processing operations. This includes the Storm operations for JSONSchema parsing, HTML parsing, STIX validation, and XML parsing. (#3033) (#3229)
- Add a new Cell configuration option, `max:users`. This can be set to limit the maximum number of non-`root` users on Cell. (#3244)
- Add an `/api/v1/aha/services` HTTP API to the Aha service. This can be used to get a list of the services registered with Aha. (#3238)
- Add support for Cosign signatures of tagged Synapse containers. See additional information at *Verifying container image signatures*. (#3196)
- Adjust internal names for Storm objects. (#3229)

17.29.4 Bugfixes

- Fix a bug in the scrape for `inet:ipv4` where IP addresses were found when there was leading or trailing numbers around the IP addresses. (#3234)
- Fix a bug where `$lib.model.ext.delForm()` did not check for extended property definitions before deletion. Extended properties on a custom form must be deleted prior to deleting the form. (#3223)
- Always remove the `mirror` configuration option from `cell.yaml` file when provisioning a service via Aha. The previous behavior prevented the correct restoration of a service from a backup which was previously provisioned as a mirror and is being restored as a leader. (#3240)
- Add additional type checking when adding extended model forms and properties to the Cortex. Previously invalid types could raise an `AttributeError`. (#3243)

17.29.5 Improved Documentation

- Update the Storm lift reference to add an example of lifting nodes by the universal `.created` property. (#3245)

17.30 v2.141.0 - 2023-07-07

17.30.1 Model Changes

- Update to the `it` and `lang` models. (#3219)

  New Properties

  `it:host`
    The form had the following properties added to it:

    `keyboard:language`
      The primary keyboard input language configured on the host.

    `keyboard:layout`
      The primary keyboard layout configured on the host.

  `lang:language`
    The form had the following property added to it:

    `code`
      The language code for this language.

17.30.2 Features and Enhancements

- Update `$lib.infosec.cvss.vectToScore()` to include a normalized CVSS vector in the output. (#3211)
- Optimize the addition and removal of lightweight edges when operating on N1 edges in Storm. (#3214)
- Added `$lib.gen.langByCode`. (#3219)

17.30.3 Bugfixes

- Fix bug with regular expression comparisons for some types. (#3213)
- Fix a `TypeError` being raised when passing a heavy Number object to `$lib.math.number()`. (#3215)
- Fix an issue with the Cell backup space checks. They now properly calculate the amount of free space when the Cell backup directory is configured on a separate volume from the Cell storage directory. (#3216)
- Prevent the `yield` operator from directly emitting nodes into the Storm pipeline if those node objects came from a different view. Nodes previously lifted in this manner must be lifted by calling the `iden()` function on the object to ensure the node being lifted into the pipeline reflects the current view. (#3218)
- Always remove the `mirror` configuration option from `cell.mods.yaml` when provisioning a service via Aha. The previous behavior prevented the correct restoration of a service from a backup which had been changed from being a leader to being a mirror. (#3220)

17.31 v2.140.1 - 2023-06-30

17.31.1 Bugfixes

- Fix a typo which prevented the Synapse package for `v2.140.0` from being published on PyPI. (#3212)

17.32 v2.140.0 - 2023-06-30

17.32.1 Announcement

Synapse now only supports Python 3.11+.

17.32.2 Model Changes

- Update to the `inet`, `file`, and `ou` models. (#3192) (#3202) (#3207)

  New Types

  `file:archive:entry`
  : Add a type to capture an archive entry representing a file and metadata from within a parent archive file.

  Updated Types

  `time`
  : Time values with precision beyond milliseconds are now truncated to millsecond values.

  `hex`
  : Hex types now have whitespace and colon (`:`) characters stripped from them when lifting and normalizing them.

  `inet:ipv6`
  : Add comparators for >=, >, <=, < operations when lifting and filtering IPV6 values.

  `ou:naics`
  : Update the type to allow recording NIACS sector and subsector prefixes.

17.32.3 Features and Enhancements

- Synapse now only supports Python 3.11+. The library will now fail to import on earlier Python interpeters, and the published modules on PyPI will no longer install on Python versions < 3.11. (#3156)
- Replace `setup.py` with a `pyproject.toml` file. (#3156) (#3195)
- Usages of `hashlib.md5()` and `hashlib.sha1()` have been updated to add the `usedforsecurity=False` argument. (#3163)
- The Storm `diff` command is now marked as safe for `readonly` execution. (#3207)
- Add a `svc:set` event to the Behold API message stream. This event is fired when a Cortex connects to a Storm Service. (#3205)

17.32.4 Bugfixes

- Catch `ZeroDivisionError` and `decimal.InvalidOperation` errors in Storm expressions and raise a `StormRuntimeError`. (#3203)
- Fix a bug where `synapse.lib.platforms.linux.getTotalMemory()` did not return the correct value in a process running in cgroupsv1 without a maximum memory limit set. (#3198)
- Fix a bug where a Cron job could be created with an invalid Storm query. Cron jobs now have their queries parsed as part of creation to ensure that they are valid Storm. `$lib.cron` APIs now accept heavy Storm query objects as query inputs. (#3201) (#3207)
- Field data sent via Storm `$lib.inet.http` APIs that uses a multipart upload without a valid `name` field now raises a `BadArg` error. Previously this would result in a Python `TypeError`. (#3199) (#3206)

17.32.5 Deprecations

- Remove the deprecated `synapse.common.lockfile()` function. (#3191)

17.33 v2.139.0 - 2023-06-16

17.33.1 Announcement

Due to the introduction of several powerful new APIs and performance improvements, Synapse will be updating to *only* support Python >=3.11. Our current plan is to drop support for Python <=3.10 in ~4 weeks on 2023-06-19. The next release after 2023-06-19 will include changes that are not backward compatible to earlier versions of Python.

If you currently deploy Synapse Open-Source or Synapse Enterprise via the standard docker containers, you will be unaffected. If you install Synapse via PyPI, you will need to ensure that your environment is updated to Python 3.11+.

17.33.2 Model Changes

- Update `it:sec:cpe` normalization to extend truncated CPE2.3 strings. (#3186)

17.33.3 Features and Enhancements

- The `str` type now accepts `float` values to normalize. (#3174)

17.33.4 Bugfixes

- Fix an issue where the `file:bytes:sha256` property set handler could fail during data merging. (#3180)
- Fix an issue where iterating light edges on nodes could result in degraded Cortex performance. (#3186)

17.33.5 Improved Documentation

- Update the Cortex admin guide to include additional examples for setting up user and role permissions. (#3187)

17.34 v2.138.0 - 2023-06-13

17.34.1 Features and Enhancements

- Add `it:sec:cwe` to the list of types identified with scrape APIs. (#3182)
- Update the calculations done by `$lib.infosec.cvss.vectToScore()` to more closely emulate the NVD CVSS calculator. (#3181)

17.34.2 Bugfixes

- Fix an issue with `synapse.tools.storm` where the `!export` command did not use the view specified when starting the tool. (#3184)
- The `synapse.common.getSslCtx()` API now only attempts to load files in the target directory. This avoids confusing errors that may be logged when the target directory contains sub directories. (#3179)
- Fix an edge case in `$lib.infosec.cvss.vectToScore()` when calculating CVSS v2 scores. (#3181)

17.34.3 Deprecations

- Mark the Python function `synapse.common.lockfile()` as deprecated. It will be removed in `v2.140.0`. (#3183)

17.35 v2.137.0 - 2023-06-09

17.35.1 Automatic Migrations

- Migrate any `inet:url` nodes with `:user` and `:passwd` properties which may have been URL encoded. These values are now decoded. (#3169)
- Migrate the storage type for the `file:bytes:mime:pe:imphash` property. (#3173)
- See *Data Migration* for more information about automatic migrations.

17.35.2 Model Changes

- Updates to the `geospace`, `inet`, `infotech`, `ou`, `risk`, and `transport` models. (#3169)

  New Types

  `it:mitre:attack:matrix`
  Add a type to capture the enumeration of MITRE ATT&CK matrix values.

  New Forms

  `inet:egress`
  Add a form to capture a host using a specific network egress client address.

`it:prod:softreg`
Add a form to capture a registry entry is created by a specific software version.

`transport:land:vehicle`
Add a form to capture an individual vehicle.

`transport:land:registration`
Add a form to capture the registration issued to a contact for a land vehicle.

`transport:land:license`
Add a form to capture the license to operate a land vehicle issued to a contact.

New Properties

`inet:http:request`
The form had the following property added to it:

`referer`
The referer URL parsed from the "Referer:" header in the request.

`inet:search:query`
The form had the following property added to it:

`request`
The HTTP request used to issue the query.

`it:mitre:attack:tactic`
The form had the following property added to it:

`matrix`
The ATT&CK matrix which defines the tactic.

`it:mitre:attack:technique`
The form had the following property added to it:

`matrix`
The ATT&CK matrix which defines the technique.

`it:mitre:attack:mitigation`
The form had the following property added to it:

`matrix`
The ATT&CK matrix which defines the mitigation.

`it:app:snort:rule`
The form had the following property added to it:

`engine`
The snort engine ID which can parse and evaluate the rule text.

`it:app:yara:rule`
The form had the following properties added to it:

`ext:id`
The YARA rule ID from an external system.

`url`
A URL which documents the YARA rule.

`ou:campaign`
The form had the following property added to it:

`tag`
The tag used to annotate nodes that are associated with the campaign.

`ou:org`
The form had the following properties added to it:

`country`
The organization's country of origin.

`country:code`
The 2 digit ISO 3166 country code for the organization's country of origin.

`risk:threat`
The form had the following properties added to it:

`country`
The reporting organization's assessed country of origin of the threat cluster.

`country:code`
The 2 digit ISO 3166 country code for the threat cluster's assessed country of origin.

`risk:compromise`
The form had the following property added to it:

`vector`
The attack assessed to be the initial compromise vector.

Light Edges

`detects`
When used with a `meta:rule` node, the edge indicates the rule was designed to detect instances of the target node.

When used with an `it:app:snort:rule` node, the edge indicates the rule was designed to detect instances of the target node.

When used with an `it:app:yara:rule` node, the edge indicates the rule was designed to detect instances of the target node.

`contains`
When used between two `geo:place` nodes, the edge indicates the source place completely contains the target place.

Deprecated Properties

`geo:place`
The form had the following property marked as deprecated:

- `parent`

17.35.3 Features and Enhancements

- Add a modulo arithmetic operator (`%`) to Storm expression parsing. (#3168)
- Add `$lib.auth.easyperm` Storm library for interacting with objects that use a simplified permissions model. (#3167)
- Add `.vars` attribute to the Storm `auth:user` object. This can be used to access user variables. (#3167)
- Add `$lib.infosec.cvss.vectToScore()` to calculate CVSS scores. (#3171)
- The Storm `delnode` command node now requires the use of `--force` to delete a node which has lightweight edges pointing to it. (#3176)
- The STIX export configuration may now include a `synapse_extension` value set to `$lib.false` to disable the Synapse STIX extension data from being added to objects in the bundle. (#3177)

- Remove whitespace stripping from Storm queries prior to parsing them. This allows any error highlighting information to accurately reflect the query submitted to the Cortex. (#3175)

17.35.4 Bugfixes

- Fix an issue where raising an integer value to a fractional power in Storm was not handled correctly. (#3170)
- Handle a SyntaxError that may occur during Storm parsing due to a change in CPython 3.11.4. (#3170)
- The `inet:url` type now URL decodes the `user` and `passwd` properties when normalizing them. Thank you `captainGeech42` for the bug report. (#2568) (#3169)
- The URL parser in `synapse.lib.urlhelp` now URL decodes the `user` and `passwd` values when parsing URLs. (#3178)

17.35.5 Deprecations

- Mark the Storm functions `$lib.infosec.cvss.saveVectToNode()` and `$lib.infosec.cvss.vectToProps()` as deprecated. (#3178)

17.36 v2.136.0 - 2023-06-02

17.36.1 Model Changes

- Boolean values in the Synapse model now have lowercase `true` and `false` repr values. (#3159)
- The trailing `.` on the taxonomy repr has been removed. (#3159)

17.36.2 Features and Enhancements

- Normalize tag names when performing lift and filter operations. (#3094)
- Add `$lib.compression.bzip2`, `$lib.compression.gzip`, and `$lib.compression.zlib` Storm libraries to assist with compressing and decompressing bytes. (#3155) (#3162)
- Add a new Cell configuration option, `https:parse:proxy:remoteip`. When this is set to `true`, the Cell HTTPS server will parse `X-Forwarded-For` and `X-Real-IP` headers to determine the remote IP of an request. (#3160)
- Update the allowed versions of the `fastjsonschema` and `pycryptodome` libraries. Update the required version of the `vcrpy` library to account for changes in `urllib3`. Remove the pinned requirement for the `requests` library. (#3164)

17.36.3 Bugfixes

- Prevent zero length tag lift operations. (#3094)
- Fix an issue where tag properties with the type `ival`, or `time` types with `ismin` or `ismax` options set, were not properly merged when being set. (#3161)
- Fix a missing `mesg` value on `NoSuchForm` exception raised by the `layer liftByTag()` API. (#3165)

17.37 v2.135.0 - 2023-05-24

17.37.1 Features and Enhancements

- Add a `--index` option to the Storm `auth.user.grant` command. (#3150)
- Add additional type handling in the Storm view and layer `set()` APIs. (#3147)
- Add a new Storm command, `auth.perms.list`, to list all of the permissions registered with the Cortex. (#3135) (#3154)

17.37.2 Bugfixes

- Fix an issue where attempting a tag lift with a variable containing a zero-length string would raise an MDB error. (#3094)
- Fix an issue in the Axon `csvrows()` and `readlines()` APIs where certain exceptions would not be raised. (#3141)
- Fix an issue with the Storm `runas` command which prevented it being used with a privileged Storm runtime. (#3147)
- Fix support for Storm list objects in `$lib.max()` and `$lib.min()`. (#3153)

17.37.3 Improved Documentation

- Update the Cortex admin guide to include the output of the `auth.perms.list` command. (#3135)

17.38 v2.134.0 - 2023-05-17

17.38.1 Model Changes

- Updates to the `risk` model. (#3137)

  Light Edges

  `addresses`

  When used with a `risk:mitigation` and a `ou:technique` node, the edge indicates the mitigation addresses the technique.

17.38.2 Features and Enhancements

- Add a `--forms` option to the Storm `scrape` command. This can be used to limit the forms that are made from scraping the input text. The `scrape` command now uses the View scrape interface to generate its matches, which may include scrape functionality added via power-ups. The `scrape` command no longer produces warning messages when matched text is not valid for making nodes. (#3127)
- Add a `revs` definition to the STIX export configuration, to allow for adding in reverse relationships. (#3137)
- Add a `--delbytes` option to the Storm `delnode` command. This can be used to delete the bytes from an Axon when deleting a `file:bytes` node. (#3140)
- Add support for printing nice versions of the Storm `model:form`, `model:property`, `model:tagprop`, and `model:type` objects. (#3134) (#3139)

17.38.3 Bugfixes

- Fix an exception that was raised when setting the parent of a View. (#3131) (#3132)
- Fix an issue with the text scrape regular expressions misidentifying the `ftp://` scheme. (#3127)
- Correctly handle `readonly` properties in the Storm `copyto` command. (#3142)
- Fix an issue were partial service backups were not able to be removed. (#3143) (#3145)

17.39 v2.133.1 - 2023-05-09

17.39.1 Bugfixes

- Fix an issue where the Storm query hashing added in `v2.133.0` did not account for handling erroneous surrogate pairs in query text. (#3130)

17.39.2 Improved Documentation

- Update the Storm API Guide to include the `hash` key in the `init` message. (#3130)

17.40 v2.133.0 - 2023-05-08

17.40.1 Model Changes

- Updates to the `risk` model. (#3123)

  New Properties

  `risk:vuln`

  The `risk:vuln` form had the following properties added to it:

  `cvss:v2`

  The CVSS v2 vector for the vulnerability.

  `cvss:v2_0:score`

  The CVSS v2.0 overall score for the vulnerability.

`cvss:v2_0:score:base`
The CVSS v2.0 base score for the vulnerability.

`cvss:v2_0:score:temporal`
The CVSS v2.0 temporal score for the vulnerability.

`cvss:v2_0:score:environmental`
The CVSS v2.0 environmental score for the vulnerability.

`cvss:v3`
The CVSS v3 vector for the vulnerability.

`cvss:v3_0:score`
The CVSS v3.0 overall score for the vulnerability.

`cvss:v3_0:score:base`
The CVSS v3.0 base score for the vulnerability.

`cvss:v3_0:scare:temporal`
The CVSS v3.0 temporal score for the vulnerability.

`cvss:v3_0:score:environmental`
The CVSS v3.0 environmental score for the vulnerability.

`cvss:v3_1:score`
The CVSS v3.1 overall score for the vulnerability.

`cvss:v3_1:score:base`
The CVSS v3.1 base score for the vulnerability.

`cvss:v3_1:scare:temporal`
The CVSS v3.1 temporal score for the vulnerability.

`cvss:v3_1:score:environmental`
The CVSS v3.1 environmental score for the vulnerability.

Deprecated Properties

`risk:vuln`
The `risk:vuln` form had the following properties marked as deprecated:

- `cvss:av`
- `cvss:ac`
- `cvss:pr`
- `cvss:ui`
- `cvss:s`
- `cvss:c`
- `cvss:i`
- `cvss:a`
- `cvss:e`
- `cvss:rl`
- `cvss:rc`
- `cvss:mav`
- `cvss:mac`

- `cvss:mpr`
- `cvss:mui`
- `cvss:ms`
- `cvss:mc`
- `cvss:mi`
- `cvss:ma`
- `cvss:cr`
- `cvss:ir`
- `cvss:ar`
- `cvss:score`
- `cvss:score:temporal`
- `cvss:score:environmental`

17.40.2 Features and Enhancements

- Update the base Synapse images to use Debian bookworm and use Python 3.11 as the Python runtime. For users which build custom images from our published images, see additional information at *Working with Synapse Images* for changes which may affect you. (#3025)
- Add a `highlight` parameter to BadSyntaxError and some exceptions raised during the execution of a Storm block. This contains detailed information about where an error occurred in the Storm code. (#3063)
- Allow callers to specify an `iden` value when creating a Storm Dmon or a trigger. (#3121)
- Add support for STIX export configs to specify pivots to include additional nodes. (#3122)
- The Storm `auth.user.addrule` and `auth.role.addrule` now have an optional `--index` argument that allows specifying the rule location as a 0-based index value. (#3124)
- The Storm `auth.user.show` command now shows the user's `admin` status on authgates. (#3124)
- Add a `--only-url` flag to the `synapse.tools.aha.provision.service` and `synapse.tools.aha.provision.user` CLI tools. When set, the tool only prints the URL to stdout. (#3125)
- Add additional layer validation in the View schema. (#3128)
- Update the allowed version of the `cryptography`, `coverage`, `idna`, `pycryptodome`, `python-bitcoin`, and `vcrpy` libraries. (#3025)

17.40.3 Bugfixes

- Ensure the CLI tools `synapse.tools.cellauth`, `synapse.tools.csvtool`, and `synapse.tools.easycert` now return 1 on an execution failure. In some cases they previously returned `-1`. (#3118)

17.41 v2.132.0 - 2023-05-02

17.41.1 Features and Enhancements

- Update the minimum required version of the `fastjsonschema`, `lark`, and `pytz` libraries. Update the allowed version of the `packaging` and `scalecodec` libraries. (#3118)

17.41.2 Bugfixes

- Cap the maximum version of the `requests` library until downstream use of that library has been updated to account for changes in `urllib3`. (#3119)
- Properly add parent scope vars to `background` command context. (#3120)

17.42 v2.131.0 - 2023-05-02

17.42.1 Automatic Migrations

- Migrate the `ou:campaign:name` property from a `str` to an `ou:campname` type and create the `ou:campname` nodes as needed. (#3082)
- Migrate the `risk:vuln:type` property from a `str` to a `risk:vuln:type:taxonomy` type and create the `risk:vuln:type:taxonomy` nodes as needed. (#3082)
- See *Data Migration* for more information about automatic migrations.

17.42.2 Features and Enhancements

- Updates to the `dns`, `inet`, `it`, `ou`, `ps`, and `risk` models. (#3082) (#3108) (#3113)

  `inet:dns:answer`
  Add a `mx:priority` property to record the priority of the MX response.

  `inet:dns:dynreg`
  Add a form to record the registration of a domain with a dynamic DNS provider.

  `inet:proto`
  Add a form to record a network protocol name.

  `inet:web:attachment`
  Add a form to record the instance of a file being sent to a web service by an account.

  `inet:web:file`
  Deprecate the `client`, `client:ipv4`, and `client:ipv6` properties in favor of using `inet:web:attachment`.

  `inet:web:logon`
  Remove incorrect `readonly` markings for properties.

  `it:app:snort:rule`
  Add an `id` property to record the snort rule id. Add an `author` property to record contact information for the rule author. Add `created` and `updated` properties to track when the rule was created and last updated. Add an `enabled` property to record if the rule should be used for snort evaluation engines. Add a `family` property to record the software family the rule is designed to detect.

`it:prod:softid`
: Add a form to record an identifier issued to a given host by a specific software application.

`ou:campname`
: Add a form to record the name of campaigns.

`ou:campaign`
: Change the `name` and `names` secondary properties from `str` to `ou:campname` types.

`ps:contact`
: Add a `place:name` to record the name of the place associated with the contact.

`risk:threat`
: Add an `active` property to record the interval of time when the threat cluster is assessed to have been active. Add a `reporter:published` property to record the time that a reporting organization first publicly disclosed the threat cluster.

`risk:tool:software`
: Add a `used` property to record the interval when the tool is assessed to have been deployed. Add a `reporter:discovered` property to record the time that a reporting organization first discovered the tool. Add a `reporter:published` property to record the time that a reporting organization first publicly disclosed the tool.

`risk:vuln:soft:range`
: Add a form to record a contiguous range of software versions which contain a vulnerability.

`risk:vuln`
: Change the `type` property from a `str` to a `risk:vuln:type:taxonomy`.

`risk:vuln:type:taxonomy`
: Add a form to record a taxonomy of vulnerability types.

- Add a new Storm command, `auth.user.allowed` that can be used to check if a user is allowed to use a given permission and why. (#3114)
- Add a new Storm command, `gen.ou.campaign`, to assist with generating or creating `ou:campaign` nodes. (#3082)
- Add a boolean `default` key to the permissions schema definition. This allows a Storm package permission to note what its default value is. (#3099)
- Data model migrations which fail to normalize existing secondary values into their new types now store those values in Node data on the affected nodes and remove those bad properties from the affected nodes. (#3117)

17.42.3 Bugfixes

- Fix an issue with the search functionality in our documentation missing the required jQuery library. (#3111)
- Unique nodes when performing multi-layer lifts on secondary properties without a value. (#3110)

17.42.4 Improved Documentation

- Add a section about managing data model deprecations to the Synapse Admin guide. (#3102)

17.42.5 Deprecations

- Remove the deprecated `synapse.lib.httpapi.HandlerBase.user()` and `synapse.lib.httpapi.HandlerBase.getUserBody()` functions. Remove the deprecated `synapse.axon.AxonFileHandler.axon()` function. (#3115)

17.43 v2.130.2 - 2023-04-26

17.43.1 Bugfixes

- Fix an issue where the `proxy` argument was not being passed to the Axon when attempting to post a file via Storm with the `$lib.inet.http.post()` API. (#3109)
- Fix an issue where adding a readonly layer that does not already exist would raise an error. (#3106)

17.44 v2.130.1 - 2023-04-25

17.44.1 Bugfixes

- Fix a race condition in a Telepath unit test which was happening during CI testing. (#3104)

17.45 v2.130.0 - 2023-04-25

17.45.1 Features and Enhancements

- Updates to the `infotech` model. (#3095)

  `it:host`

  Add an `ext:id` property for recording an external identifier for a host.
- Add support for deleting node properties by assigning `$lib.undef` to the property to be removed through `$node.props`. (#3098)
- The `Cell.ahaclient` is longer cached in the `synapse.telepath.aha_clients` dictionary. This isolates the Cell connection to Aha from other clients. (#3008)
- When the Cell mirror loop exits, it now reports the current `ready` status to the Aha service. This allows a service to mark itself as “not ready” when the loop restarts and it is a follower, since it may no longer be in the realtime change window. (#3008)
- Update the required versions of the `nbconvert`, `sphinx` and `hide-code` libraries used for building documentation. Increased the allowed ranges for the `pygments` and `jupyter-client` libraries. (#3103)

17.45.2 Bugfixes

- Fix an issue in backtick format strings where single quotes in certain positions would raise a syntax error. (#3096)
- Fix an issue where permissions were not correctly checked when assigning a property value through `$node.props`. (#3098)
- Fix an issue where the Cell would report a static `ready` value to the Aha service upon reconnecting, instead of the current `ready` status. The `Cell.ahainfo` value was replaced with a `Cell.getAhaInfo()` API which returns the current information to report to the Aha service. (#3008)

17.46 v2.129.0 - 2023-04-17

17.46.1 Features and Enhancements

- Updates to the `ou` and `risk` models. (#3080)

  `ou:campaign`
  Add a `names` property to record alternative names for the campaign. Add `reporter` and `reporter:name` properties to record information about a reporter of the campaign.

  `risk:attack`
  Add `reporter` and `reporter:name` properties to record information about a reporter of the attack.

  `risk:compromise`
  Add `reporter` and `reporter:name` properties to record information about a reporter of the compromise.

  `risk:vuln`
  Add `reporter` and `reporter:name` properties to record information about a reporter of the vulnerability.

- Add leader status to the `synapse.tools.aha.list` tool output. This will only be available if a leader has been registered for the service. (#3078)
- Add support for private values in Storm modules, which are specified by beginning the name with a double underscore (`__`). These values cannot be dereferenced outside of the module they are declared in. (#3079)
- Update error messages for Axon.wget, Axon.wput, and Axon.postfiles to include more helpful information. (#3077)
- Update `it:semver` string normalization to attempt parsing improperly formatted semver values. (#3080)
- Update Axon to always pass size value when saving bytes. (#3084)

17.46.2 Bugfixes

- Add missing `toprim()` calls on arguments to some `auth:user` and `auth:role` APIs. (#3086)
- Fix the regular expression used to validate custom STIX types. (#3093)

17.46.3 Improved Documentation

- Add sections on user and role permissions to the Synapse Admin guide. (#3073)

17.47 v2.128.0 - 2023-04-11

17.47.1 Automatic Migrations

- Migrate the `file:bytes:mime:pe:imphash` property from a `guid` to a `hash:md5` type and create the `hash:md5` nodes as needed. (#3056)
- Migrate the `ou:goal:name` property from a `str` to a `ou:goalname` type and create the `ou:goalname` nodes as needed. (#3056)
- Migrate the `ou:goal:type` property from a `str` to a `ou:goal:type:taxonomy` type and create the `ou:goal:type:taxonomy` nodes as needed. (#3056)
- See *Data Migration* for more information about automatic migrations.

17.47.2 Features and Enhancements

- Updates to the `belief`, `file`, `lang`, `it`, `meta`, `ou`, `pol`, and `risk` models. (#3056)

  `belief:tenet`
  : Add a `desc` property to record the description of the tenet.

  `file:bytes`
  : Change the type of the `mime:pe:imphash` from `guid` to `hash:md5`.

  `inet:flow`
  : Add a `raw` property which may be used to store additional protocol data about the flow.

  `it:app:snort:rule`
  : Add a `desc` property to record a brief description of the snort rule.

  `ou:goal`
  : Change the type of `name` from `str` to `ou:goalname`. Change the type of `type` from `str` to `ou:goal:type:taxonomy`. Add a `names` array to record alternative names for the goal. Deprecate the `prev` property in favor of types.

  `ou:goalname`
  : Add a form to record the name of a goal.

  `ou:goalname:type:taxonomy`
  : Add a taxonomy of goal types.

  `ou:industry`
  : Add a `type` property to record the industry taxonomy.

  `ou:industry:type:taxonomy`
  : Add a taxonomy to record industry types.

  `pol:immigration:status`
  : Add a form to track the immigration status of a contact.

  `pol:immigration:status:type:taxonomy`
  : Add a taxonomy of immigration types.

`risk:attack`
Add a `detected` property to record the first confirmed detection time of the attack. Add a `url` property to record a URL that documents the attack. Add a `ext:id` property to record an external identifier for the attack.

`risk:compromise`
Add a `detected` property to record the first confirmed detection time of the compromise.

- Add a Storm command `copyto` that can be used to create a copy of a node from the current view to a different view. (#3061)
- Add the current View iden to the structured log output of a Cortex executing a Storm query. (#3068)
- Update the allowed versions of the `lmdb`, `msgpack`, `tornado` and `xxhash` libraries. (#3070)
- Add Python 3.11 tests to the CircleCI configuration. Update some unit tests to account for Python 3.11 related changes. (#3070)
- Allow dereferencing from Storm expressions. (#3071)
- Add an `ispart` parameter to `$lib.tags.prefix` to skip `syn:tag:part` normalization of tag names. (#3074)
- Add `getEdges()`, `getEdgesByN1()`, and `getEdgesByN2()` APIs to the `layer` object. (#3076)

17.47.3 Bugfixes

- Fix an issue which prevented the `auth.user.revoke` Storm command from executing. (#3069)
- Fix an issue where `$node.data.list()` only returned the node data from the topmost layer containing node data. It now returns all the node data accessible for the node from the current view. (#3061)

17.47.4 Improved Documentation

- Update the Developer guide to note that the underlying Python runtime in Synapse images may change between releases. (#3070)

17.48 v2.127.0 - 2023-04-05

17.48.1 Features and Enhancements

- Set `Link` high water mark to one byte in preparation for Python 3.11 support. (#3064)
- Allow specifying dictionary keys in Storm with expressions and backtick format strings. (#3065)
- Allow using deref syntax (`*$form`) when lifting by form with tag (`*$form#tag`) and form with tagprop (`*$form#tag:tagprop`). (#3065)
- Add `cron:start` and `cron:stop` messages to the events emitted by the `behold()` API on the Cortex. These events are only emitted by the leader. (#3062)

17.48.2 Bugfixes

- Fix an issue where an Aha service running on a non-default port would not have that port included in the default Aha URLs. (#3049)
- Restore the `view.addNode()` Storm API behavior where making a node on a View object that corresponds to the currently executing view re-used the current Snap object. This allows nodeedits to be emitted from the Storm message stream. (#3066)

17.49 v2.126.0 - 2023-03-30

17.49.1 Features and Enhancements

- Add additional Storm commands to assist with managing Users and Roles in the Cortex. (#2923) (#3054)

  `auth.gate.show`
  Shows the definition for an AuthGate.

  `auth.role.delrule`
  Used to delete a rule from a Role.

  `auth.role.mod`
  Used to modify properties of a Role.

  `auth.role.del`
  Used to delete a Role.

  `auth.role.show`
  Shows the definition for a Role.

  `auth.role.list`
  List all Roles.

  `auth.user.delrule`
  Used to delete a rule from a User.

  `auth.user.grant`
  Used to grant a Role to a User.

  `auth.user.revoke`
  Used to revoke a Role from a User.

  `auth.role.mod`
  Used to modify properties of a User.

  `auth.user.show`
  Shows the definition of a User.

  `auth.user.list`
  List all Users.

- Update some of the auth related objects in Storm: (#2923)

  `auth:role`
  Add `popRule()` and `getRules()` functions. Add a `.gates` accessor to get all of the AuthGates associated with a role.

  `auth:user`
  Add `popRule()` and `getRules()` functions. Add a `.gates` accessor to get all of the AuthGates associated with a user.

- Add `$lib.auth.textFromRule()`, `$lib.auth.getPermDefs()` and `$lib.auth.getPermDef()` Storm library APIs to assist with working with permissions. (#2923)
- Add a new Storm library function, `$lib.iters.enum()`, to assist with enumerating an iterable object in Storm. (#2923)
- Update the `NoSuchName` exceptions which can be raised by Aha during service provisioning to clarify they are likely caused by re-using the one-time use URL. (#3047)
- Update `gen.ou.org.hq` command to set `ps:contact:org` if unset. (#3052)
- Add an `optional` flag for Storm package dependencies. (#3058)
- Add `.]`, `[.`, `http[:`, `https[:`, `hxxp[:` and `hxxps[:` to the list of known defanging strategies which are identified and replaced during text scraping. (#3057)

17.49.2 Bugfixes

- Fix an issue where passing a non-string value to `$lib.time.parse` with `errok=$lib.true` would still raise an exception. (#3046)
- Fix an issue where context managers could potentially not release resources after exiting. (#3055)
- Fix an issue where variables with non-string names could be passed into Storm runtimes. (#3059)
- Fix an issue with the Cardano regex used for scraping addresses. (#3057)
- Fix an issue where scraping a partial Cardano address could raise an error. (#3057)
- Fix an issue where the Storm API `view.addNode()` checked permissions against the incorrect authgate. This API now only returns a node if the View object is the same as the View the Storm query is executing in. (#3060)

17.49.3 Improved Documentation

- Fix link to Storm tool in Synapse Power-Ups section. (#3053)
- Add Kubernetes deployment examples, which show deploying Synapse services with Aha based provisioning. Add an example showing one mechanism to set `sysctl`'s in a managed Kubernetes deployment. (#3047)

17.50 v2.125.0 - 2023-03-14

17.50.1 Features and Enhancements

- Add a `size()` method on the STIX bundle object. (#3043)
- Update the minimum version of the `aio-socks` library to `0.8.0`. Update some unittests related to SOCKS proxy support to account for multiple versions of the `python-socks` library. (#3044)

17.50.2 Improved Documentation

- Update the Synapse documentation to add PDF and HTMLZip formats.

17.51 v2.124.0 - 2023-03-09

17.51.1 Features and Enhancements

- Added `--try` option to `gen.risk.vuln`, `gen.pol.country`, `gen.pol.country.government`, and `gen.ps.contact.email` commands and their associated Storm functions. (#3030)
- Added `$lib.gen.orgHqByName` and `$lib.gen.langByName`. (#3030)
- Added the configuration option `onboot:optimize` to all services to allow devops to delay service startup and allow LMDB to optimize storage for both size and performance. May also be set by environment variable `SYN_<SERVICE>_ONBOOT_OPTIMIZE=1` (#3001)
- Ensure that `AuthDeny` exceptions include the user iden in the `user` key, and the name in the `username` field. Previously the `AuthDeny` exceptions had multiple identifiers for these fields. (#3035)
- Add an optional `--view` argument to the `synapse.tools.storm` CLI tool. This allows a user to specify their working View for the Storm CLI. This was contributed by captainGeech42. (#2937)
- Updates to `synapse.lib.scope` and the `Scope` class. A `Scope.copy()` method has been added to create a shallow copy of a `Scope`. A module level `clone(task)` function has been added which clones the current task scope to the target `task`. Async Tasks created with `Base.schedCoro()` calls now get a shallow copy of the parent task scope. (#3021)
- Add a new Storm command, `batch`, to assist in processing nodes in batched sets. (#3034)
- Add global permissions, `` ` ``storm.macro.admin`` and `storm.macro.edit`, to allow users to administer or edit macros. (#3037)
- Mark the following Storm APIs as safe to execute in read-only queries: `$lib.auth.users.get()`, `$lib.auth.users.list()`, `$lib.auth.users.byname()`, `$lib.auth.roles.get()`, `$lib.auth.roles.list()`, `$lib.auth.roles.byname()`, `$lib.auth.gates.get()` and `$lib.auth.gates.list()`. (#3038)
- Added `uplink` key to `getCellInfo()`, which indicates whether the Cell is currently connected to an upstream mirror. (#3041)

17.51.2 Bugfixes

- Fix an issue in the Storm grammar where part of a query could potentially be incorrectly parsed as an unquoted case statement. (#3032)
- Fix an issue where exceptions could be raised which contained data that was not JSON serializable. `$lib.raise` arguments must now also be JSON safe. (#3029)
- Fix an issue where a spawned process returning a non-pickleable exception would not be handled properly. (#3036)
- Fix an issue where a locked user could login to a Synapse service on a TLS Telepath connection if the connection presented a trusted client certificate for the locked user. (#3035)
- Fix a bug in `Scope.enter()` where the added scope frame was not removed when the context manager was exited. (#3021)

- Restoring a service via the `SYN_RESTORE_HTTPS_URL` environment variable could timeout when downloading the file. The total timeout for this process has been disabled. (#3042)

17.51.3 Improved Documentation

- Update the Synapse glossary to add terms related to the permissions system. (#3031)
- Update the model docstrings for the `risk` model. (#3027)

17.51.4 Deprecations

- The `ctor` support in `Scope` has been removed. The population of the global default scope with environment variables has been removed. (#3021)

17.52 v2.123.0 - 2023-02-22

17.52.1 Automatic Migrations

- If the `risk:vuln:cvss:av` property equals `V` it is migrated to `P`. (#3013)
- Parse `inet:http:cookie` nodes to populate the newly added `:name` and `:value` properties. (#3015)
- See *Data Migration* for more information about automatic migrations.

17.52.2 Features and Enhancements

- Added the `belief` model which includes the following new forms: (#3015)

  `belief:system`
  A belief system such as an ideology, philosophy, or religion.

  `belief:tenet`
  A concrete tenet potentially shared by multiple belief systems.

  `belief:subscriber`
  A contact which subscribes to a belief system.

  `belief:system:type:taxonomy`
  A hierarchical taxonomy of belief system types.

- Added declaration for `risk:compromise -(uses)> ou:technique` light-weight edges. (#3015)
- Updated `inet:http:session` and `inet:http:request` forms to include the following property: (#3015)

  `:cookies`
  An array of `inet:http:cookie` values associated with the node.

- Updated the `inet:http:cookie` form to include the following properties: (#3015)

  `name`
  The name of the cookie preceding the equal sign.

  `value`
  The value of the cookie after the equal sign if present.

- Added logic to allow constructing multiple `inet:http:cookie` nodes by automatically splitting on `;` such as `foo=bar; baz=faz` (#3015)
- Updated `it:log:event` to add the following properties: (#3015)

  type
  : An `it:log:event:type:taxonomy` type for the log entry.

  ext:id
  : An external ID that uniquely identifies this log entry.

  product
  : An `it:prod:softver` of the product which produced the log entry.

- Updated the `risk:compromise` form to include the following properties: (#3015)

  goal
  : An `ou:goal` node representing the assessed primary goal of the compromise.

  goals
  : An array of `ou:goal` nodes representing additional goals of the compromise.

- Updated `risk:attack` and `risk:compromise` forms to deprecate the `techniques` property in favor of using `-(uses)> ou:technique` light-weight edges. (#3015)
- Updates to the `inet:dns`, and `media` models. (#3005) (#3017)

  inet:dns:answer
  : Remove all read-only flags present on the secondary properties for this form.

  media:news
  : Add an `updated` property to record last time the news item was updated.

- Updated `inet:flow` to include the following properties: (#3017)

  src:ssh:key
  : The key sent by the client as part of an SSH session setup.

  dst:ssh:key
  : The key sent by the server as part of an SSH session setup.

  src:ssl:cert
  : The x509 certificate sent by the client as part of an SSL/TLS negotiation.

  dst:ssl:cert
  : The x509 certificate sent by the server as part of an SSL/TLS negotiation.

  src:rdp:hostname
  : The hostname sent by the client as part of an RDP session setup.

  src:rdp:keyboard:layout
  : The keyboard layout sent by the client as part of an RDP session setup.

- Add `synapse.utils.stormcov`, a Coverage.py plugin for measuring code coverage of Storm files. (#2961)
- Clean up several references to the `cell.auth` object in HTTP API handlers. Move the logic in `/api/v1/auth/onepass/issue` API handler to the base Cell. (#2998) (#3004)
- Clarify the error message encountered by a Synapse mirrored service if the mirror gets desynchronized from its upstream service. (#3006)
- Update how read-only properties are handled during merges. The `.created` property will always be set when merging a node down. If two nodes have other conflicting read-only property values, those will now emit a warning in the Storm runtime. (#2989)

- The Axon.wget() API response now includes HTTP request history, which is added when the API request encounters redirects. The $lib.axon.wget() Storm API now includes information about the original request URL. This data is now used to create inet:urlredir nodes, such as when the Storm wget command is used to retrieve a file. (#3011)
- Ensure that BadTypeValu exceptions raised when normalizing invalid data with the time type includes the value in the exception message. (#3009)
- Add a callback on Slab size expansion to trigger a free disk space check on the related cell. (#3016)
- Add support for choices in Storm command arguments. (#3019)
- Add an optional parameter to the Storm uniq command to allow specifying a relative property or variable to operate on rather than node iden. (#3018)
- Synapse HTTP API logs now include the user iden and username when that information is available. For deployments with structured logging enabled, the HTTP path, HTTP status code, user iden, and username are added to that log message. (#3007)
- Add web_useriden and web_username attributes to the Synapse HTTP Handler class. These are used for HTTP request logging to populate the user iden and username data. These are automatically set when a user authenticates using a session token or via basic authentication. The HTTP Session tracking now tracks the username at the time the session was created. The _web_user value, which previously pointed to a heavy HiveUser object, is no longer populated by default. (#3007)
- Add $lib.inet.http.codereason Storm API for translating HTTP status codes to reason phrases. inet:http:resp objects now also have a reason value populated. (#3023)
- Update the minimum version of the cryptography library to 39.0.1 and the minimum version of the pyopenssl library to 23.0.0. (#3022)

17.52.3 Bugfixes

- The Storm wget command created inet:urlfile nodes with the url property of the resolved URL from aiohttp. This made it so that a user could not pivot from an inet:url node which had a URL encoded parameter string to the resulting inet:urlfile node. The inet:urlfile nodes are now made with the original request URL to allow that pivoting to occur. (#3011)
- The Axon.wget() and $lib.axon.wget() APIs returned URLs in the url field of their responses which did not contain fragment identifiers. These API responses now include the fragment identifier if it was present in the resolved URL. (#3011)
- The Storm tree command did not properly handle Storm query arguments which were declared as storm:query types. (#3012)
- Remove an unnecessary permission check in the Storm movenodes command which could cause the command to fail. (#3002)
- When a user email address was provided to the HTTP API /api/v1/auth/adduser, the handler did not properly set the email using change controlled APIs, so that information would not be sent to mirrored cells. The email is now being set properly. (#2998)
- The risk:vuln:cvss:av enum incorrectly included V instead of P. (#3013)
- Fix an issue where the ismax specification on time types did not merge time values correctly. (#3017)
- Fix an issue where using a function call to specify the tag in a tagprop operation would not be correctly parsed. (#3020)

17.52.4 Improved Documentation

- Update copyright notice to always include the current year. (#3010)

17.52.5 Deprecations

- The `synapse.lib.httpapi.Handler.user()` and `synapse.lib.httpapi.Handler.getUserBody()` methods are marked as deprecated. These methods will be removed in Synapse `v2.130.0`. (#3007)

17.53 v2.122.0 - 2023-01-27

17.53.1 Features and Enhancements

- Updates to the `biz`, `file`, `lang`, `meta`, `pol`, and `risk` models. (#2984)

  `biz:service`
  Add a `launched` property to record when the operator first made the service available.

  `file:bytes`
  Add `exe:compiler` and `exe:packer` properties to track the software used to compile and encode the file.

  `lang:language`
  Add a new guid form to represent a written or spoken language.

  `lang:name`
  Add a new form to record the name of a language.

  `meta:node`
  Add a `type` property to record the note type.

  `meta:note:type:taxonomy`
  Add a form to record an analyst defined taxonomy of note types.

  `pol:country`
  Correct the `vitals` property type from `ps:vitals` to `pol:vitals`.

  `ps:contact`
  Add a `lang` property to record the language specified for the contact.

  Add a `langs` property to record the alternative languages specified for the contact.

  `ps:skill`
  Add a form to record a specific skill which a person or organization may have.

  `ps:skill:type:taxonomy`
  Add a form to record a taxonomy of skill types.

  `ps:proficiency`
  Add a form to record the assessment that a given contact possesses a specific skill.

  `risk:alert`
  Add a `priority` property that can be used to rank alerts by priority.

  `risk:compromise`
  Add a `severity` property that can be used as a relative severity score for the compromise.

  `risk:threat`
  Add a `type` property to record the type of the threat cluster.

risk:threat:type:taxonomy
Add a form to record a taxonomy of threat types.

- Add support for Python 3.10 to Synapse. (#2962)
- Update the Synapse docker containers to be built from a Debian based image, instead of an Ubuntu based image. These images now use Python 3.10 as the Python runtime. (#2962)
- Add an optional `--type` argument to the Storm `note.add` command. (#2984)
- Add a Storm command, `gen.lang.language`, to lift or generate a `lang:language` node by name. (#2984)
- Update the allowed versions of the `cbor2` library; and upgrade the versions of `aiostmplib` and `aiohttp-socks` to their latest versions. (#2986)
- The `X-XSS-Protection` header was removed from the default HTTP API handlers. This header is non-standard and only supported by Safari browsers. Service deployments which rely on this header should use the `https:headers` configuration option to inject that header into their HTTP responses. (#2997)

17.53.2 Bugfixes

- Malformed hash values normalized as `file:bytes` raised exceptions which were not properly caught, causing Storm ?= syntax to fail. Malformed values are now properly handled in `file:bytes`. (#3000)

17.53.3 Improved Documentation

- Update the Storm filters user guide to include expression filters (#2997)
- Update Storm type-specific behavior user guide to clarify `guid` deconfliction use cases and some associated best practices. (#2997)
- Update Storm command reference user guide to document `gen.*` commands. (#2997)

17.53.4 Deprecations

- The Cortex APIs `provStacks()` and `getProvStack(iden)` have been removed. (#2995)

17.54 v2.121.1 - 2022-01-23

17.54.1 Bugfixes

- When creating Storm Macros using `v2.121.0`, the creator of the Macro was incorrectly set to the `root` user. This is now set to the user that created the macro using the Storm `macro.set` command or the `$lib.macro.set()` API. (#2993)

17.55 v2.121.0 - 2022-01-20

17.55.1 Automatic Migrations

- Storm Macros stored in the Cortex are migrated from the Hive to the Cortex LMDB slab. (#2973)
- See *Data Migration* for more information about automatic migrations.

17.55.2 Features and Enhancements

- Updates to the `inet` and `ou` models. (#2982) (#2987)

  `inet:dns:soa`
  The `fqdn`, `ns` and `email` properties had the read-only flag removed from them.

  `ou:org`
  Add a `goals` property to record the assessed goals of the organization.

- Add extended permissions for Storm Macro functionality using a new simplified permissions system. This allows users to opt into assigning users or roles the permission to read, write, administrate, or deny access to their Macros. These permissions can be set by the Storm `$lib.macro.grant()` API. (#2973)
- Add extended information about a Storm Macro, including its creation time, update time, and a description. The Macro name, description and Storm can now be set via the Storm `$lib.macro.mod()` API. (#2973)
- Allow users and Power-Ups to store graph projection definitions in the Cortex. Graph projections have the same simplified permissions system applied to them as introduced for Storm Macros. Storm users can now also load a stored graph projection into a running Storm query. These new features are exposed via the Storm `$lib.graph` APIs. (#2914)
- The disk space required to make the backup of a Synapse service is now checked prior to a live backup being made. If there is insufficient storage to make the backup on the volume storing the backup, a LowSpace exception will be raised. (#2990)

17.55.3 Bugfixes

- When normalizing the `inet:email` type, an unclear Python `ValueError` could have been raised to a user. This is now caught and a specific `BadTypeValu` exception is raised. (#2982)
- The `synapse.exc.StormRaise` exception caused an error when recreating the exception on the client side of a Telepath connection. This exception will now raise properly on the caller side. (#2985)
- When using the Storm `diff` command to examine a forked View, if a node was deleted out from the base layer and edited in the fork, an exception would be raised. This situation is now properly handled. (#2988)

17.55.4 Improved Documentation

- Update the Storm User Guide section on variables for clarity. (#2968)
- Correct Provenance API deprecation notice from `v2.221.0` to `v2.122.0`. (#2981)

17.56 v2.120.0 - 2023-01-11

17.56.1 Features and Enhancements

- Update to the `risk` models. (#2978)

  `risk:threat`
  Add a `merge:time` and `merged:isnow` properties to track when a threat cluster was merged with another threat cluster.

  `risk:alert`
  Add an `engine` property to track the software engine that generated the alert.

- Add events for `trigger:add`, `trigger:del`, and `trigger:set` to the Beholder API. (#2975)

17.56.2 Bugfixes

- Fix an infinite loop in `synapse.tools.storm` when using the tool in an environment without write access to the history file. (#2977)

17.57 v2.119.0 - 2023-01-09

17.57.1 Features and Enhancements

- Updates to the `biz`, `econ`, `ou`, and `risk` models. (#2931)

  `biz:listing`
  Add a form to track a specific product or service listed for sale at a given price by a specific seller.

  `biz:service`
  Add a form to track a service performed by a specific organization.

  `biz:service:type`
  Add a form to record an analyst defined taxonomy of business services.

  `biz:bundle`
  Add a `service` property to record the service included in the bundle.

  Deprecate the `deal` and `purchase` secondary properties in favor of `econ:receipt:item` to represent bundles being sold.

  `biz:product`
  Add a `price:currency` property to denote the currency of the prices.

  Add a `maker` property to represent the contact information for the maker of a product.

  Deprecate the `madeby:org`, `madeby:orgname`, `madeby:orgfqdn` properties in favor of using the new `maker` property.

  `econ:receipt:item`
  Add a form to represent a line item included as part of a purchase.

  `econ:acquired`
  Deprecate the form in favor of an `acquired` light edge.

`ou:campaign`
Add a `budget` property to record the budget allocated for the campaign.

Add a `currency` property to record the currency of the `econ:price` secondary properties.

Add a `result:revenue` property to record the revenue resulting from the campaign.

Add a `result:pop` property to record the count of people affected by the campaign.

`risk:alert:verdict:taxonomy`
Add a form to record an analyst defined taxonomy of the origin and validity of an alert.

`risk:alert`
Add a `benign` property to record if the alert has been confirmed as benign or malicious.

Add a `verdict` property to record the analyst verdict taxonomy about why an alert is marked as benign or malicious.

- Annotate the following light edges. (#2931)

`acquired`
When used with an `econ:purchase` node, the edge indicates the purchase was used to acquire the target node.

`ipwhois`
When used with an `inet:whois:iprec` node and `inet:ipv4` or `inet:ipv6` nodes, the edge indicates the source IP whois record describes the target IP address.

- Add a new Cell configuration option, `limit:disk:free`. This represents the minimum percentage of free disk space on the volume hosting a Synapse service that is required in order to start up. This value is also monitored every minute and will disable the Cell Nexus if the free space drops below the specified value. This value defaults to five percent (`5 %`) free disk space. (#2920)

17.57.2 Improved Documentation

- Add a Devops task related to configuration of the free space requirement. (#2920)

17.58 v2.118.0 - 2023-01-06

17.58.1 Features and Enhancements

- Updates to the `inet`, `pol`, and `ps` models. (#2970) (#2971)

`inet:tunnel`
Add a form to represent the specific sequence of hosts forwarding connections, such as a VPN or proxy.

`inet:tunnel:type:taxonomy`
Add a form to record an analyst defined taxonomy of network tunnel types.

`pol:country`
Add a `government` property to represent the organization for the government of the country.

`ps:contact`
Add a `type` property to record the taxonomy of the node. This may be used for entity resolution.

`ps:contact:type:taxonomy`
Add a form to record an analyst defined taxonomy of contact types.

- Add the following Storm commands to help with analyst generation of several guid node types: (#2970)

`gen.it.prod.soft`
: Lift (or create) an `it:prod:soft` node based on the software name.

`gen.ou.industry`
: Lift (or create) an `ou:industry` node based on the industry name.

`gen.ou.org`
: Lift (or create) an `ou:org` node based on the organization name.

`gen.ou.org.hq`
: Lift (or create) the primary `ps:contact` node for the ou:org based on the organization name.

`gen.pol.country`
: Lift (or create) a `pol:country` node based on the 2 letter ISO-3166 country code.

`gen.pol.country.government`
: Lift (or create) the `ou:org` node representing a country's government based on the 2 letter ISO-3166 country code.

`gen.ps.contact.email`
: Lift (or create) the `ps:contact` node by deconflicting the email and type.

`gen.risk.threat`
: Lift (or create) a `risk:threat` node based on the threat name and reporter name.

`gen.risk.tool.software`
: Lift (or create) a `risk:tool:software` node based on the tool name and reporter name.

`gen.risk.vuln`
: Lift (or create) a `risk:vuln` node based on the CVE.

- Add `$lib.gen.riskThreat()`, `$lib.gen.riskToolSoftware()`, `$lib.gen.psContactByEmail()`, and `$lib.gen.polCountryByIso2()` Storm API functions to assist in generating `risk:threat`, `risk:tool:software`, `ps:contact` and `pol:country` nodes. (#2970)
- Update the CRL bundled within Synapse to revoke the `The Vertex Project Code Signer 00` key. (#2972)

17.58.2 Bugfixes

- Fix an issue in the Axon `csvrows()` and `readlines()` APIs which could cause the Axon service to hang. (#2969)

17.59 v2.117.0 - 2023-01-04

17.59.1 Automatic Migrations

- The `risk:tool:software:soft:names` and `risk:tool:software:techniques` properties are migrated to being unique arrays. (#2950)
- See *Data Migration* for more information about automatic migrations.

17.59.2 Features and Enhancements

- Updates to the `risk` model. (#2950)

  `risk:tool:software`
  The `soft:names` and `techniques` properties are converted into sorted and uniqued arrays.

- Add support to the Cortex `addStormPkg()` and `$lib.pkg.add()` APIs to load Storm Packages which have been signed to allow cryptographic signature verification. Root CA and intermediate CA certificates have been embedded into Synapse to allow for verification of Rapid Power-Ups signed by The Vertex Project. (#2940) (#2957) (#2963)
- Update `synapse.tools.genpkg` to add optional code signing to Storm packages that it creates. (#2940)
- Update `synapse.tools.genpkg` to require the packages it produces will be JSON compatible when serialized, to avoid possible type coercion issues introduced by the Python `json` library. (#2958)
- Update `synapse.tools.easycert` to allow for creating code signing certificates and managing certificate revocation lists (CRLs). (#2940)
- Add the Nexus index (`nexsindx`) value to the data returned by the `getCellInfo()` APIs. (#2949)
- Allow the Storm backtick format strings to work with multiline strings. (#2956)
- The Storm `Bytes.json()` method now raises exceptions that are `SynErr` subclasses when encountering errors. This method has been updated to add optional `encoding` and `errors` arguments, to control how data is deserialized. (#2945)
- Add support for registering an OAuth2 provider in the Cortex and having user tokens automatically refreshed in the background. These APIs are exposed in Storm under the `$lib.inet.http.oauth.v2` library. (#2910)
- STIX validation no longer caches any downloaded files it may use when attempting to validate STIX objects. (#2966)
- Modified the behavior of Storm emitter functions to remove the read-ahead behavior. (#2953)

17.59.3 Bugfixes

- Fix some error messages in the Snap which did not properly add variables to the message. (#2951)
- Fix an error in the `synapse.tools.aha.enroll` command example. (#2948)
- Fix an error with the `merge` command creating `No form named None` warnings in the Cortex logs. (#2952)
- Fix the Storm `inet:smtp:message` getter and setter for the `html` property so it will correctly produce HTML formatted messages. (#2955)
- Several `certdir` APIs previously allowed through `openssl.crypto.X509StoreContextError` and `openssl.crypto.Error` exceptions. These now raise Synapse `BadCertVerify` and `BadCertBytes` exceptions. (#2940)
- Fix an issue where a Storm package's `modconf` values were mutable. (#2964)

17.59.4 Improved Documentation

- Removed outdated Kubernetes related devops documentation as it is in the process of being rewritten. (#2948)

17.59.5 Deprecations

- The Cortex APIs `provStacks()` and `getProvStack(iden)` and the corresponding Cortex configuration option `provenance:en` have been marked as deprecated and are planned to be removed in `v2.122.0`. (#2682)

17.60 v2.116.0 - 2022-12-14

17.60.1 Automatic Migrations

- The `ou:contract:award:price` and `ou:contract:budget:price` properties are migrated from `econ:currency` to `econ:price` types. (#2943)
- See *Data Migration* for more information about automatic migrations.

17.60.2 Features and Enhancements

- Updates to the `ou` model. (#2943)

  `ou:contract`
  : The `award:price` and `budget:price` properties had their types changed from `econ:currency` to `econ:price`. Add a `currency` secondary property to record the currency of the `econ:price` values.

17.60.3 Bugfixes

- The `synapse.tools.genpkg` tool could raise a Python `TypeError` when the specified package file did not exist. It now raises a `NoSuchFile` exception. (#2941)
- When a service is provisioned with an `aha:provision` URL placed in a `cell.yaml` file, that could create an issue when a mirror is deployed from that service, preventing it from starting up a second time. Services now remove the `aha:provision` key from a `cell.yaml` file when they are booted from a mirror if the URL does not match the boot URL. (#2939)
- When deleting a node from the Cortex, secondary properties defined as arrays were not checked for their references to other nodes. These references are now properly checked prior to node deletion. (#2942)

17.60.4 Improved Documentation

- Add a Devops task for stamping custom users into Synapse containers to run services with arbitrary user and group id values. (#2921)
- Remove an invalid reference to `insecure` mode in HTTP API documentation. (#2938)

17.61 v2.115.1 - 2022-12-02

17.61.1 Features and Enhancements

- Patch release to include an updated version of the `pytest` library in containers.

17.62 v2.115.0 - 2022-12-01

17.62.1 Automatic Migrations

- The `inet:flow:dst:softnames` and `inet:flow:dst:softnames` properties are migrated from `it:dev:str` to `it:prod:softname` types. (#2930)
- See *Data Migration* for more information about automatic migrations.

17.62.2 Features and Enhancements

- Updates to the `inet` model. (#2930)

  `inet:flow`
  The `dst:softnames` and `src:softnames` properties had their types changed from `it:dev:str` values to `it:prod:softname`.

- Add support for secondary property pivots where the target property is an array type. (#2922)
- The Storm API `$lib.bytes.has()` now returns a false value when the input is null. (#2924)
- When unpacking loop values in Storm, use the primitive value when the item being unpacked is a Storm primitive. (#2928)
- Add a `--del` option to the `synapse.tools.moduser` tool to allow removing a user from a service. (#2933)
- Add entrypoint hooks to the Aha, Axon, Cortex, Cryotank, and JsonStor containers that allow a user to hook the container boot process. (#2919)
- Temporary files created by the Axon, Cortex and base Cell class are now created in the cell local `tmp` directory. In many deployments, this would be located in `/vertex/storage/tmp`. (#2925)
- Update the allowed versions of the `cbor2` and `pycryptodome` libraries. For users installing `synapse[dev]`, `coverage`, `pytest`, `pytest-cov` and `pytest-xdist` are also updated to their latest versions. (#2935)

17.62.3 Bugfixes

- When a Storm Dmon definition lacked a `view` iden, it would previously default to using the Cortex default view. Dmons now prefer to use the user default view before using the Cortex default view. This situation would only happen with Dmons created via the Telepath API where the `view` iden was not provided in the Dmon definition. (#2929)
- Non-integer mask values provided to `inet:cidr4` types now raise a `BadTypeValu` exception. (#2932)
- Fix an incorrect call to `os.unlink` in `synapse.tools.aha.enroll`. (#2926)

17.62.4 Improved Documentation

- Update the automation section of the Synapse User guide, expanding upon the use of cron jobs and triggers across views and forks. (#2917)

17.63 v2.114.0 - 2022-11-15

17.63.1 Features and Enhancements

- Updates to the `crypto` model. (#2909)

  `crypto:key`
  Add `iv` and `mode` properties to record initialization vectors and cipher modes used with a key.

- Allow the creator for Cron jobs and the user for Triggers to be set. This can be used to effectively change the ownership of these automation elements. (#2908)
- When Storm package `onload` queries produce print, warning, or error messages, those now have the package name included in the message that is logged. (#2913)
- Update the Storm package schema to allow declaring configuration variables. (#2880)

17.63.2 Bugfixes

- The `delCertPath()` APIs in `synapse.lib.easycert` no longer attempt to create a file path on disk when removing the reference count to a certificate path. (#2907)
- Fix error handling when Axon is streaming files with the `readlines()` and `csvrows()` APIs. (#2911)
- The Storm `trigger.list` command failed to print triggers which were created in a Cortex prior to `v2.71.0`. These triggers no longer generate an exception when listed. (#2915)
- Fix an error in the HTTP API example documentation for the `requests` example. (#2918)

17.63.3 Improved Documentation

- Add a Devops task to enable the Python warnings filter to log the use of deprecated Synapse APIs. Python APIs which have been deprecated have had their docstrings updated to reflect their deprecation status. (#2905)

17.64 v2.113.0 - 2022-11-04

17.64.1 Automatic Migrations

- The `risk:tool:software:type` property is migrated to the `risk:tool:software:taxonomy` type. (#2900)
- See *Data Migration* for more information about automatic migrations.

17.64.2 Features and Enhancements

- Updates to the `inet`, `infotech`, `media`, `meta`, `ou`, and `risk` models. (#2897) (#2900) (#2903)

  `inet:email:message:link`
  Add a `text` property to record the displayed hypertext link if it was not a raw URL.

  `inet:web:acct`
  Add a `banner` property representing the banner image for the account.

  `inet:web:mesg`
  Add a `deleted` property to mark if a message was deleted.

  `inet:web:post:link`
  Add a form to record a link contained in the post text.

  `it:mitre:attack:group`
  Add an `isnow` property to record the potential for MITRE groups to be deprecated and renamed.

  `it:mitre:attack:software`
  Add an `isnow` property to record the potential for MITRE software to be deprecated and renamed.

  `it:prod:soft:taxonomy`
  Add a form to record an analyst defined taxonomy of software.

  `it:prod:soft`
  Add a `type` property to record the taxonomy of the software. Deprecated the `techniques` property in favor of the `uses` light edge.

  `it:sec:cve`
  Deprecated the `desc`, `url` and `references` properties in favor of using the `risk:vuln:cve:desc`, `risk:vuln:cve:url`, and `risk:vuln:cve:references` properties.

  `media:news`
  Add a `topics` array property to record a list of relevant topics in the article.

  `media:topic`
  Add a form for recording different media topics.

  `meta:rule`
  Add a `url` property to record a URL that documents as rule.

  Add an `ext:id` property to record an external identifier for the rule.

  `meta:sophistication`
  Add a form to record sophistication score with named values: `very low`, `low`, `medium`, `high`, and `very high`.

  `ou:campaign`
  Add a `sophistication` property to record the assessed sophistication of a campaign.

  Deprecate the `techniques` property in favor of using the `uses` light edge.

  `ou:hasgoal`
  Deprecate the `ou:hasgoal` form in favor of using the `ou:org:goals` property.

  `ou:org`
  Deprecate the `techniques` property in favor of using the `uses` light edge.

  `ou:technique`
  Add a `sophistication` property to record the assessed sophistication of a technique.

  `risk:alert`
  Add a `url` property for a URL that documents the alert.

Add an `ext:id` property to record an external ID for the alert.

risk:attack
Add a `sophistication` property to record the assessed sophistication of an attack.

risk:availability
Add a taxonomy for availability status values.

risk:threat
Add a `sophistication` property to record the assessed sophistication of a threat cluster.

Deprecate the `techniques` property in favor of the `uses` light edge.

risk:tool:software
Add an `availability` property to record the assessed availability of the tool.

Add a `sophistication` property to record the assessed sophistication of the software.

Migrate the `type` property to `risk:tool:software:taxonomy`.

Deprecate the `techniques` property in favor of the `uses` light edge.

risk:tool:software:taxonomy
Rename the type `risk:tool:taxonomy` to `risk:tool:software:taxonomy`.

risk:vuln
Add a `mitigated` property to record if a mitigation or fix is available for the vulnerability.

Add an `exploited` property to record if the vulnerability has been exploited in the wild.

Add `timeline:discovered`, `timeline:published`, `timeline:vendor:notified`, `timeline:vendor:fixed`, and `timeline:exploited` properties to record the timeline for significant events on a vulnerability.

Add `cve:desc`, `cve:url`, and `cve:references` secondary properties to record information about the CVE associated with a vulnerability.

Add `` `nist:nvd:source `` to record the name of the organization which reported the vulnerability in the NVD.

Add `nist:nvd:published` and `nist:nvd:modified` to record when the vulnerability was first published, and later modified, in the NVD.

Add `cisa:kev:name`, `cisa:kev:desc`, `cisa:kev:action`, `cisa:kev:vendor`, `cisa:kev:product`, `cisa:kev:added`, `cisa:kev:duedate` properties to record information about the CISA KEV database entry for the vulnerability.

- Annotate the following light edges. (#2900)

seen
When used with `meta:source` nodes, the edge indicates the target node was observed by the source node.

stole
When used with a `risk:compromise` node, the edge indicates the target node was stolen or copied as a result of the compromise.

targets
When used with `risk:attack`, the edge indicates the target node is targeted by the attack.

When used with `risk:attack` and `ou:industry` nodes, the edge indicates the attack targeted the industry

When used with `risk:threat`, the edge indicates the target node is targeted by the threat cluster.

When used with `risk:threat` and `ou:industry` nodes, the edge indicates the threat cluster targets the industry.

uses

When used with `ou:campaign` and `ou:technique` nodes, the edge indicates the campaign used a given technique.

When used with `ou:org` and `ou:technique` nodes, the edge indicates the organization used a given technique.

When used with `risk:threat`, the edge indicates the target node was used to facilitate the attack.

When used with `risk:attack` and `ou:technique` nodes, the edge indicates the attack used a given technique.

When used with `risk:attack` and `risk:vuln` nodes, the edge indicates the attack used the vulnerability.

When used with `risk:tool:software`, the edge indicates the target node is used by the tool.

When used with `risk:tool:software` and `ou:technique` nodes, the edge indicates the tool uses the technique.

When used with `risk:tool:software` and `risk:vuln` nodes, the edge indicates the tool used the vulnerability.

When used with `risk:threat`, the edge indicates the target node was used by threat cluster.

When used with `risk:threat` and `ou:technique` nodes, the edge indicates the threat cluster uses the technique.

When used with `risk:threat` and `risk:vuln` nodes, the edge indicates the threat cluster uses the vulnerability.

- Add `$lib.gen.vulnByCve()` to help generate `risk:vuln` nodes for CVEs. (#2903)
- Add a unary negation operator to Storm expression syntax. (#2886)
- Add `$lib.crypto.hmac.digest()` to compute RFC2104 digests in Storm. (#2902)
- Update the Storm `inet:http:resp.json()` method to add optional `encoding` and `errors` arguments, to control how data is deserialized. (#2898)
- Update the Storm `bytes.decode()` method to add an optional `errors` argument, to control how errors are handled when decoding data. (#2898)
- Logging of role and user permission changes now includes the authgate iden for the changes. (#2891)

17.64.3 Bugfixes

- Catch `RecursionError` exceptions that can occur in very deep Storm pipelines. (#2890)

17.64.4 Improved Documentation

- Update the Storm reference guide to explain backtick format strings. (#2899)
- Update `guid` section on Storm type-specific behavior doc with some additional guid generation examples. (#2901)
- Update Storm control flow documentation to include `init`, `fini`, and `try` / `catch` examples. (#2901)
- Add examples for creating extended model forms and properties to the Synapse admin guide. (#2904)

17.65 v2.112.0 - 2022-10-18

17.65.1 Features and Enhancements

- Add `--email` as an argument to `synapse.tools.moduser` to allow setting a user's email address. (#2891)
- Add support for `hxxp[s]:` prefixes in scrape functions. (#2887)
- Make the SYNDEV_NEXUS_REPLAY resolution use `s_common.envbool()` in the `SynTest.withNexusReplay()` helper. Add `withNexusReplay()` calls to all test helpers which make Cells which previously did not have it available. (#2889) (#2890)
- Add implementations of `getPermDef()` and `getPermDefs()` to the base Cell class. (#2888)

17.65.2 Bugfixes

- Fix an idempotency issue in the JsonStor multiqueue implementation. (#2890)

17.65.3 Improved Documentation

- Add Synapse-GCS (Google Cloud Storage) Advanced Power-Up to the Power-Ups list.

17.66 v2.111.0 - 2022-10-12

17.66.1 Features and Enhancements

- Update the Storm grammar to allow specifying a tag property with a variable. (#2881)
- Add log messages for user and role management activities in the Cell. (#2877)
- The logging of service provisioning steps on Aha and when services were starting up was previously done at the `DEBUG` level. These are now done at the `INFO` level. (#2883)
- The `vertexproject/synapse:` docker images now have the environment variable `SYN_LOG_LEVEL` set to `INFO`. Previously this was `WARNING`. (#2883)

17.66.2 Bugfixes

- Move the Nexus `runMirrorLoop` task to hang off of the Telepath Proxy and not the Telepath client. This results in a faster teardown of the `runMirrorLoop` task during Nexus shutdown. (#2878)
- Remove duplicate tokens presented to users in Storm syntax errors. (#2879)
- When bootstrapping a service mirror with Aha provisioning, the `prov.done` file that was left in the service storage directory was the value from the upstream service, and not the service that has been provisioned. This resulted in `NoSuchName` exceptions when restarting mirrors. The bootstrapping process now records the correct value in the `prov.done` file. (#2882)

17.67 v2.110.0 - 2022-10-07

17.67.1 Features and Enhancements

- Updates to the geo model. (#2872)

  geo:telem
  Add an accuracy property to record the accuracy of the telemetry reading.

- Add Nexus support to the Axon, to enable mirrored Axon deployments. (#2871)
- Add Nexus support for HTTP API sessions. (#2869)
- Add support for runtime string formatting in Storm. This is done with backtick (` ) encapsulated strings. An example of this is `$world='world' $lib.print(`hello {$world}`)` (#2870) (#2875)
- Expose user profile storage on the auth:user object, with the profile ctor. (#2876)
- Storm package command names are now validated against the same regex used by the grammar. The synapse.tools.genpkg tool now validates the compiled package against the same schema used by the Cortex. (#2864)
- Add $lib.gen.newsByUrl() and $lib.gen.softByName() to help generate media:news and it:prod:soft nodes, respectively. (#2866)
- Add a new realtime event stream system to the Cell, accessible remotely via CellApi.behold() and a websocket endpoint, /api/v1/behold. This can be used to get realtime changes about services, such as user creation or modification events; or layer and view change events in the Cortex. (#2851)
- Update stored user password hashing to use PBKDF2. Passwords are migrated to this format as successful user logins are performed. (#2868)
- Add the ability to restore a backup tarball from a URL to the Cell startup process. When a Cell starts via initFromArgv(), if the environment variable SYN_RESTORE_HTTPS_URL is present, that value will be used to retrieve a tarball via HTTPS and extract it to the service local storage, removing any existing data in the directory. This is done prior to any Aha based provisioning. (#2859)

17.67.2 Bugfixes

- The embedded Axon inside of a Cortex (used when the axon config option is not set) did not properly have its cell parent set to the Cortex. This has been corrected. (#2857)
- Fix a typo in the cron.move help. (#2858)

17.67.3 Improved Documentation

- Update Storm and Storm HTTP API documentation to show the set of opts and different types of message that may be streamed by from Storm APIs. Add example HTTP API client code to the Synapse repository. (#2834)
- Update the Data Model and Analytical model background documentation. Expand on the discussion of light edges use. Expand discussion of tags versus forms, linking the two via :tag props. (#2848)

17.67.4 Deprecations

- The Cortex HTTP API endpoint `/api/v1/storm/nodes` has been marked as deprecated. (#2682)
- Add deprecation notes to the help for the Storm `splice.undo` and `splice.list` commands. (#2861)
- Provisional Telepath support for Consul based lookups was removed. (#2873)

17.68 v2.109.0 - 2022-09-27

17.68.1 Features and Enhancements

- Add a `format()` API to `str` variables in Storm. (#2849)
- Update the Telepath user resolution for TLS links to prefer resolving users by the Cell `aha:network` over the certificate common name. (#2850)
- Update all Synapse tools which make telepath connections to use the `withTeleEnv()` helper. (#2844)
- Update the Telepath and HTTPs TLS listeners to drop RSA based key exchanges and disable client initiated renegotiation. (#2845)
- Update the minimum allowed versions of the `aioimaplib` and `oauthlib` libraries. (#2847) (#2854)

17.68.2 Bugfixes

- Correct default Telepath `cell://` paths in Synapse tools. (#2853)
- Fix typos in the inline documentation for several model elements. (#2852)
- Adjust expression syntax rules in Storm grammar to remove incorrect whitespace sensitivity in certain expression operators. (#2846)

17.68.3 Improved Documentation

- Update Storm and Storm HTTP API documentation to show the set of `opts` and different types of message that may be streamed by from Storm APIs. Add example HTTP API client code to the Synapse repository. (#2834)
- Update the Data Model and Analytical model background documentation. Expand on the discussion of light edges use. Expand discussion of tags versus forms, linking the two via `:tag` props. (#2848)

17.69 v2.108.0 - 2022-09-12

17.69.1 Features and Enhancements

- Update the Telepath TLS connections to require a minimum TLS version of 1.2. (#2833)
- Update the Axon implementation to use the `initServiceStorage()` and `initServiceRuntime()` methods, instead of overriding `__anit__`. (#2837)
- Update the minimum allowed versions of the `aiosmtplib` and `regex` libraries. (#2832) (#2841)

17.69.2 Bugfixes

- Catch `LarkError` exceptions in all Storm query parsing modes. (#2840)
- Catch `FileNotFound` errors in `synapse.tools.healthcheck`. This could be caused by the tool running during container startup, and prior to a service making its Unix listening socket available. (#2836)
- Fix an issue in `Axon.csvrows()` where invalid data would cause processing of a file to stop. (#2835)
- Address a deprecation warning in the Synapse codebase. (#2842)
- Correct the type of `syn:splice:splice` to be `data`. Previously it was `str`. (#2839)

17.69.3 Improved Documentation

- Replace `livenessProbe` references with `readinessProbe` in the Kubernetes documentation and examples. The `startupProbe.failureThreshold` value was increased to its maximum value. (#2838)
- Fix a typo in the Rapid Power-Up documentation. (#2831)

17.70 v2.107.0 - 2022-09-01

17.70.1 Automatic Migrations

- Migrate the `risk:alert:type` property to a `taxonomy` type and create new nodes as needed. (#2828)
- Migrate the `pol:country:name` property to a `geo:name` type and create new nodes as needed. (#2828)
- See *Data Migration* for more information about automatic migrations.

17.70.2 Features and Enhancements

- Updates to the `geo`, `inet`, `media`, `pol`, `proj`, and `risk` models. (#2828) (#2829)

  `geo:area`
  Add a new type to record the size of a geographic area.

  `geo:place:taxonomy`
  Add a form to record an analyst defined taxonomy of different places.

  `geo:place`
  Add a `type` property to record the taxonomy of a place.

  `inet:web:memb`
  This form has been deprecated.

  `inet:web:member`
  Add a guid form that represents a web account's membership in a channel or group.

  `media:news:taxonomy`
  Add a form to record an analyst defined taxonomy of different types or sources of news.

  `media:news`
  Add a `type` property to record the taxonomy of the news. Add an `ext:id` property to record an external identifier provided by a publisher.

  `pol:vitals`
  Add a guid form to record the vitals for a country.

pol:country
Add names, place, dissolved and vitals secondary properties. The name is changed from a str to a geo:name type. Deprecate the pop secondary property.

pol:candidate
Add an incumbent property to note if the candidate was an incumbent in a race.

proj
Add missing docstrings to the proj model forms.

risk:alert:taxonomy
Add a form to record an analyst defined taxonomy of alert types.

risk:alert
The type property is changed from a str to the risk:alert:taxonomy type.

- Add ** as a power operator for Storm expression syntax. (#2827)
- Add a new test helper, synapse.test.utils.StormPkgTest to assist with testing Rapid Power-Ups. (#2819)
- Add $lib.axon.metrics() to get the metrics from the Axon that the Cortex is connected to. (#2818)
- Add pack() methods to the auth:user and auth:role objects. This API returns the definitions of the User and Role objects. (#2823)
- Change the Storm Package require values to log debug messages instead of raising exceptions if the requirements are not met. Add a $lib.pkg.deps() API that allows inspecting if a package has its dependencies met or has conflicts. (#2820)

17.70.3 Bugfixes

- Prevent None objects from being normalized as tag parts from variables in Storm. (#2822)
- Avoid intermediate conversion to floats during storage operations related to Synapse Number objects in Storm. (#2825)

17.70.4 Improved Documentation

- Add Developer documentation for writing Rapid Power-Ups. (#2803)
- Add the synapse.tests.utils package to the Synapse API autodocs. (#2819)
- Update Devops documentation to note the storage requirements for taking backups of Synapse services. (#2824)
- Update the Storm min and max command help to clarify their usage. (#2826)

17.71 v2.106.0 - 2022-08-23

17.71.1 Features and Enhancements

- Add a new tool, synapse.tools.axon2axon, for copying the data from one Axon to another Axon. (#2813) (#2816)

17.71.2 Bugfixes

- Subquery filters did not update runtime variables in the outer scope. This behavior has been updated to make subquery filter behavior consistent with regular subqueries. (#2815)
- Fix an issue with converting the Number Storm primitive into its Python primitive. (#2811)

17.72 v2.105.0 - 2022-08-19

17.72.1 Features and Enhancements

- Add a Number primitive to Storm to facilitate fixed point math operations. Values in expressions which are parsed as floating point values will now be Numbers by default. Values can also be cast to Numbers with `$lib.math.number()`. (#2762)
- Add `$lib.basex.encode()` and `$lib.basex.decode()` for encoding and decoding strings using arbitrary charsets. (#2807)
- The tag removal operator (`-#`) now accepts lists of tags to remove. (#2808)
- Add a `$node.difftags()` API to calculate and optionally apply the difference between a list of tags and those present on a node. (#2808)
- Scraped Ethereum addresses are now returned in their EIP55 checksummed form. This change also applies to lookup mode. (#2809)
- Updates to the `mat`, `ps`, and `risk` models. (#2804)

  `mass`
  Add a type for storing mass with grams as a base unit.

  `ps:vitals`
  Add a form to record statistics and demographic data about a person or contact.

  `ps:person`
  Add a `vitals` secondary property to record the most recent known vitals for the person.

  `ps:contact`
  Add a `vitals` secondary property to record the most recent known vitals for the contact.

  `risk:tool:taxonomy`
  Add a form to record an analyst defined taxonomy of different tools.

  `risk:tool:software`
  Add a form to record software tools used in threat activity.

  `risk:threat`
  Add `reporter`, `reporter:name`, `org:loc`, `org:names`, and `goals` secondary properties.

- Annotate the following light edges. (#2804)

  `uses`
  When used with `risk:threat` nodes, the edge indicates the target node is used by the source node.

17.72.2 Bugfixes

- Fix language used in the `model.deprecated.check` command. (#2806)
- Remove the `-y` switch in the `count` command. (#2806)

17.73 v2.104.0 - 2022-08-09

17.73.1 Automatic Migrations

- Migrate *crypto:x509:cert:serial* from *str* to *hex* type. Existing values which cannot be converted as integers or hex values will be moved into nodedata under the key `migration:0_2_10` as `{'serial': value}` (#2789)
- Migrate `ps:contact:title` to the `ou:jobtitle` type and create `ou:jobtitle` nodes. (#2789)
- Correct hugenum property index values for values with more than 28 digits of precision. (#2766)
- See *Data Migration* for more information about automatic migrations.

17.73.2 Features and Enhancements

- Updates to the `crypto` and `ps` models. (#2789)

  `crypto:x509:cert`
  The `serial` secondary property has been changed from a `str` to a `hex` type.

  `ps:contact`
  The type of the `title` secondary property has been changed from a `str` to an `ou:jobtitle`.

- Add `$lib.hex.toint()`, `$lib.hex.fromint()`, `$lib.hex.trimext()` and `$lib.hex.signext()` Storm APIs for handling hex encoded integers. (#2789)
- Add `set()` and `setdefault()` APIs on the SynErr exception class. Improve support for unpickling SynErr exceptions. (#2797)
- Add logging configuration to methods which are called in spawned processes, and log exceptions occurring in the processes before tearing them down. (#2795)

17.73.3 Bugfixes

- BadTypeValu errors raised when normalizing a tag timestamp now include the name of the tag being set. (#2797)
- Correct a CI issue that prevented the v2.103.0 Docker images from being published. (#2798)

17.73.4 Improved Documentation

- Update data model documentation. (#2796)

17.74 v2.103.0 - 2022-08-05

17.74.1 Features and Enhancements

- Updates to the `it`, `ou`, and `risk` models. (#2778)

  `it:prod:soft`
  Add a `techniques` secondary property to record techniques employed by the author of the software.

  `ou:campaign`
  Add a `techniques` secondary property to record techniques employed by the campaign.

  `ou:org`
  Add a `techniques` secondary property to record techniques employed by the org.

  `ou:technique`
  Add a form to record specific techniques used to achieve a goal.

  `ou:technique:taxonomy`
  Add a form to record an analyst defined taxonomy of different techniques.

  `risk:attack`
  Add a `techniques` secondary property to record techniques employed during the attack. Deprecate the following secondary properties, in favor of using light edges.

  - `target`
  - `target:host`
  - `target:org`
  - `target:person`
  - `target:place`
  - `used:email`
  - `used:file`
  - `used:host`
  - `used:server`
  - `used:software`
  - `used:url`
  - `used:vuln`
  - `via:email`
  - `via:ipv4`
  - `via:ipv6`
  - `via:phone`

  `risk:compromise`
  Add a `techniques` secondary property to record techniques employed during the compromise.

  `risk:threat`
  Add a form to record a threat cluster or subgraph of threat activity attributable to one group.

- Annotate the following light edges. (#2778)

targets
When used with `ou:org`, `ou:campaign`, `risk:threat`, or `risk:attack` nodes, the edge indicates the target node was targeted by the source node.

uses
When used with an `ou:campaign` or `risk:attack` node, the edge indicates the target node is used by the source node.

- Change the behavior of the Storm `count` command to consume nodes. If the previous behavior is desired, use the `--yield` option when invoking the `count` command. (#2779)
- Add `$lib.random.int()` API to Storm for generating random integers. (#2783)
- Add a new tool, `synapse.tools.livebackup` for taking a live backup of a service. (#2788)
- The Storm `$lib.jsonstor.cacheset()` API now returns a dict containing the path and time. The `$lib.jsonstor.cacheget()` API now has an argument to retrieve the entire set of enveloped data. (#2790)
- Add a HTTP 404 handler for the Axon `v1/by/sha256/<sha256>` endpoint which catches invalid `<sha256>` values. (#2780)
- Add helper scripts for doing bulk Synapse Docker image builds and testing. (#2716)
- Add `aha:\\` support to `synapse.tools.csvtool`. (#2791)

17.74.2 Bugfixes

- Ensure that errors that occur when backing up a service are logged prior to tearing down the subprocess performing the backup. (#2781)
- Add missing docstring for `$lib.stix.import`. (#2786)
- Allow setting tags on a Node from a Storm `List` object. (#2782)

17.74.3 Improved Documentation

- Remove `synapse-google-ct` from the list of Rapid Power-Ups. (#2779)
- Add developer documentation for building Synapse Docker containers. (#2716)
- Fix spelling errors in model documentation. (#2782)

17.74.4 Deprecations

- The `vertexproject/synapse:master-py37` and `vertexproject/synapse:v2.x.x-py37` Docker containers are no longer being built. (#2716)

17.75 v2.102.0 - 2022-07-25

17.75.1 Features and Enhancements

- Updates to the `crypto`, `geo`, `inet`, `mat`, `media`, `ou`, `pol`, and `proj` models. (#2757) (#2771)

  `crypto:key`
  : Add `public:md5`, `public:sha1`, and `public:sha256` secondary properties to record those hashes for the public key. Add `private:md5`, `private:sha1`, and `private:sha256` secondary properties to record those hashes for the public key.

  `geo:nloc`
  : The `geo:nloc` form has been deprecated.

  `geo:telem`
  : Add a new form to record a the location of a given node at a given time. This replaces the use of `geo:nloc`.

  `it:sec:c2:config`
  : Add a `proxies` secondary property to record proxy URLS used to communicate to a C2 server. Add a `listens` secondary property to record urls the software should bind. Add a `dns:resolvers` secondary property to record DNS servers the software should use. Add a `http:headers` secondary property to record HTTP headers the software should use.

  `it:exec:query`
  : Add a new form to record an instance of a query executed on a host.

  `it:query`
  : Add a new form to record query strings.

  `mat:type`
  : Add a taxonomy type to record taxonomies of material specifications or items.

  `mat:item`
  : Add a `type` secondary property to record the item type.

  `mat:spec`
  : Add a `type` secondary property to record the item type.

  `media:news`
  : Add a `publisher` secondary property to record the org that published the news. Add a `publisher:name` secondary property to record the name of the org. Deprecate the `org` secondary property.

  `ou:campaign`
  : Add a `conflict` secondary property to record the primary conflict associated the campaign.

  `ou:conflict`
  : Add a new form to record a conflict between two or more campaigns which have mutually exclusive goals.

  `ou:contribution`
  : Add a new form to represent contributing material support to a campaign.

  `pol:election`
  : Add a new form to record an election.

  `pol:race`
  : Add a new form to record indivdual races in an election.

  `pol:office`
  : Add a new form to record an appointed or elected office.

`pol:term`
: Add a new form to record the term in office for an individual.

`pol:candidate`
: Add a form to record a candidate for a given race.

`pol:pollingplace`
: Add a form to record the polling locations for a given election.

`proj:ticket`
: Add a `ext:creator` secondary form to record contact information from and external system.

- Annotate the following light edges. (#2757)

  `about`
  : A light edge created by the Storm `note.add` command, which records the relationship between a `meta:note` node and the target node.

  `includes`
  : When used with a `ou:contribution` node, the edge indicates the target node was the contribution made.

  `has`
  : When used with a `meta:ruleset` and `meta:rule` node, indicates the ruleset contains the rule.

  `matches`
  : When used with a `meta:rule` node, the edge indicates the target node matches the rule.

  `refs`
  : A light edge where the source node refers to the target node.

  `seenat`
  : When used with a `geo:telem` target node, the edge indicates the source node was seen a given location.

  `uses`
  : When used with a `ou:org` node, the edge indicates the target node is used by the organization.

- Commonly used light edges are now being annotated in the model, and are available through Cortex APIs which expose the data model. (#2757)
- Make Storm command argument parsing errors into exceptions. Previously the argument parsing would cause the Storm runtime to be torn down with `print` messages, which could be missed. This now means that automations which have a invalid Storm command invocation will fail loudly. (#2769)
- Allow a Storm API caller to set the task identifier by setting the `task` value in the Storm `opts` dictionary. (#2768) (#2774)
- Add support for registering and exporting custom STIX objects with the `$lib.stix` Storm APIS. (#2773)
- Add APIS and Storm APIs for enumerating mirrors that have been registered with AHA. (#2760)

17.75.2 Bugfixes

- Ensure that auto-adds are created when merging part of a View when using the Storm `merge --apply` command. (#2770)
- Add missing support for handling timezone offsets without colon separators when normalizing `time` values. `time` values which contain timezone offsets and not enough data to resolve minute level resolution will now fail to parse. (#2772)
- Fix an issue when normalizing `inet:url` values when the host value was the IPv4 address `0.0.0.0`. (#2771)
- Fix an issue with the Storm `cron.list` command, where the command failed to run when a user had been deleted. (#2776)

17.75.3 Improved Documentation

- Update the Storm user documentation to include the Embedded Property syntax, which is a shorthand (`::`) that can be used to reference properties on adjacent nodes. (#2767)
- Update the Synapse Glossary. (#2767)
- Update Devops documentation to clarify the Aha URLs which end with``...`` are intentional. (#2775)

17.76 v2.101.1 - 2022-07-14

17.76.1 Bugfixes

- Fix an issue where the Storm `scrape` command could fail to run with inbound nodes. (#2761)
- Fix broken links in documentation. (#2763)
- Fix an issue with the Axon `AxonHttpBySha256V1` API handler related to detecting `Range` support in the Axon. (#2764)

17.77 v2.101.0 - 2022-07-12

17.77.1 Automatic Migrations

- Create nodes in the Cortex for the updated properties noted in the data model updates listed below.
- Axon indices are migrated to account for storing offset information to support the new offset and size API options.
- See *Data Migration* for more information about automatic migrations.

17.77.2 Features and Enhancements

- Updates to the `crypto`, `infotech`, `ps`, and `transport` models. (#2720) (#2738) (#2739) (#2747)

  crypto:smart:effect:minttoken
  Add a new form to model smart contract effects which create non-fungible tokens.

  crypto:smart:effect:burntoken`
  Add a new form to model smart contract effects which destroy non-fungible tokens.

  crypto:smart:effect:proxytoken
  Add a new form that tracks grants for a non-owner address the ability to manipulate a specific non-fungible token.

  crypto:smart:effect:proxytokenall
  Add a new form that tracks grants for a non-owner address the ability to manipulate all of the non-fungible tokens.

  crypto:smart:effect:proxytokens
  Add a new form that tracks grants for a non-owner address to manipulate fungible tokens.

  it:av:signame
  Add a new form to track AV signature names. Migrate `it:av:filehit:sig:name` and `it:av:sig:name` to use the new form.

`it:exec:proc`
: Add a `name` secondary property to track the display name of a process. Add a `path:base` secondary property to track the basename of the executable for the process.

`ps:contact`
: Add an `orgnames` secondary property to track an array of orgnames associated with a contact.

`transport:sea:vessel`
: Add `make` and `model` secondary properties to track information about the vessel.

- Add a new Storm command, `movenodes`, that can be used to move a node entirely from one layer to another. (#2714)
- Add a new Storm library, `$lib.gen`, to assist with creating nodes based on secondary property based deconfliction. (#2754)
- Add a `sorted()` method to the `stat:tally` object, to simplify handling of tallied data. (#2748)
- Add a new Storm function, `$lib.mime.html.totext()`, to extract inner tag text from HTML strings. (#2744)
- Add Storm functions `$lib.crypto.hashes.md5()`, `$lib.crypto.hashes.sha1()`, `$lib.crypto.hashes.sha256()` and `$lib.crypto.hashes.sha512()` to allow hashing bytes directly in Storm. (#2743)
- Add an `Axon.csvrows()` API for streaming CSV rows from an Axon, and a corresponding `$lib.axon.csvrows()` Storm API. (#2719)
- Expand Synapse requirements to include updated versions of the `pycryptome`, `pygments`, and `scalecodec` modules. (#2752)
- Add range support to `Axon.get()` to read bytes from a given offset and size. The `/api/v1/axon/files/by/sha256/<SHA-256>` HTTP API has been updated to support a `Range` header that accepts a `bytes` value to read a subset of bytes that way as well. (#2731) (#2755) (#2758)

17.77.3 Bugfixes

- Fix `$lib.time.parse()` when `%z` is used in the format specifier. (#2749)
- Non-string form-data fields are now serialized as JSON when using the `Axon.postfiles()` API. (#2751) (#2759)
- Fix a byte-alignment issue in the `Axon.readlines()` API. (#2719)

17.78 v2.100.0 - 2022-06-30

17.78.1 Features and Enhancements

- Support parsing CVSS version 3.1 prefix values. (#2732)

17.78.2 Bugfixes

- Normalize tag value lists in `snap.addTag()` to properly handle JSON inputs from HTTP APIs. (#2734)
- Fix an issue that allowed multiple concurrent streaming backups to occur. (#2725)

17.78.3 Improved Documentation

- Add an entry to the devops task documentation for trimming Nexus logs. (#2730)
- Update the list of available Rapid Power-Ups. (#2735)

17.79 v2.99.0 - 2022-06-23

17.79.1 Features and Enhancements

- Add an extensible STIX 2.1 import library, `$lib.stix.import`. The function `$lib.stix.import.ingest()` can be used to STIX bundles into a Cortex via Storm. (#2727)
- Add a Storm `uptime` command to display the uptime of a Cortex or a Storm Service configured on the Cortex. (#2728)
- Add `--view` and `--optsfile` arguments to `synapse.tools.csvtool`. (#2726)

17.79.2 Bugfixes

- Fix an issue getting the maximum available memory for a host running with Linux cgroupsv2 apis. (#2728)

17.80 v2.98.0 - 2022-06-17

17.80.1 Features and Enhancements

- Updates to the `econ` model. (#2717)

  `econ:acct:balance`
  : Add `total:received` and `total:sent` properties to record total currency sent and received by the account.

- Add additional debug logging for Aha provisioning. (#2722)
- Adjust whitespace requirements on Storm grammar related to tags. (#2721)
- Always run the function provided to the Storm `divert` command per node. (#2718)

17.80.2 Bugfixes

- Fix an issue that prevented function arguments named `func` in Storm function calls. (#2715)
- Ensure that active coroutines have been cancelled when changing a Cell from active to passive status; before starting any passive coroutines. (#2713)
- Fix an issue where `Nexus._tellAhaReady` was registering with the Aha service when the Cell did not have a proper Aha service name set. (#2723)

17.81 v2.97.0 - 2022-06-06

17.81.1 Features and Enhancements

- Add an `/api/v1/aha/provision/service` HTTP API to the Aha service. This can be used to generate `aha:provision` URLs. (#2707)
- Add `proxy` options to `$lib.inet.http` Storm APIs, to allow an admin user to specify an alternative (or to disable) proxy setting. (#2706)
- Add a `--tag` and `--prop` option to the Storm `diff` command. Update the Storm `merge` command examples to show more real-world use cases. (#2710)
- Add the ability to set the layers in a non-forked view with the `$view.set(layers, $iden)` API on the Storm view object. (#2711)
- Improve Storm parser logic for handling list and expression syntax. (#2698) (#2708)

17.81.2 Bugfixes

- Improve error handling of double quoted strings in Storm when null characters are present in the raw query string. This situation now raises a BadSyntax error instead of an opaque Python ValueError. (#2709)
- Fix unquoted JSON keys which were incorrectly allowed in Storm JSON style expression syntax. (#2698)
- When merging layer data, add missing permission checks for light edge and node data changes. (#2671)

17.82 v2.96.0 - 2022-05-31

17.82.1 Features and Enhancements

- Updates to the `transport` model. (#2697)

  `velocity`
  : Add a new base type to record velocities in millimeters/second.

  `transport:direction`
  : Add a new type to indicate a direction of movement with respect to true North.

  `transport:air:telem`
  : Add `:course` and `:heading` properties to record the direction of travel. Add `:speed`, `:airspeed` and `:verticalspeed` properties to record the speed of travel.

`transport:sea:telem`
Add `:course` and `:heading` properties to record the direction of travel. Add a `:speed` property to record the speed of travel. Add `:destination`, `:destination:name` and `:destination:eta` to record information about the destination.

- Restore the precedence of environment variables over `cell.yaml` options during Cell startup. API driven overrides are now stored in the `cell.mods.yaml` file. (#2699)
- Add `--dmon-port` and `--https-port` options to the `synapse.tools.aha.provision.service` tool in order to specify fixed listening ports during provisioning. (#2703)
- Add the ability of `synapse.tools.moduser` to set user passwords. (#2695)
- Restore the call to the `recover()` method on the Nexus during Cell startup. (#2701)
- Add `mesg` arguments to `NoSuchLayer` exceptions. (#2696)
- Make the LMDB slab startup more resilient to a corrupted `cell.opts.yaml` file. (#2694)

17.82.2 Bugfixes

- Fix missing variable checks in Storm. (#2702)

17.82.3 Improved Documentation

- Add a warning to the deployment guide about using Docker on Mac OS. (#2700)

17.83 v2.95.1 - 2022-05-24

17.83.1 Bugfixes

- Fix a regression in the Telepath `aha://` update from `v2.95.0`. (#2693)

17.84 v2.95.0 - 2022-05-24

17.84.1 Features and Enhancements

- Add a `search` mode to Storm. The `search` mode utilizes the Storm search interface to lift nodes. The `lookup` mode no longer uses the search interface. (#2689)
- Add a `?mirror=true` flag to `aha://` Telepath URLs which will cause the Aha service lookups to prefer using a mirror of the service rather than the leader. (#2681)
- Add `$lib.inet.http.urlencode()` and `$lib.inet.http.urldecode()` Storm APIs for handling URL encoding. (#2688)
- Add type validation for all Cell configuration options throughout the lifetime of the Cell and all operations which modify its configuration values. This prevents invalid values from being persisted on disk. (#2687) (#2691)

17.84.2 Bugfixes

- Fix an issue where the = sign in the Storm grammar was assigned an anonymous terminal name by the grammar parser. This caused an issue with interpreting various syntax errors. (#2690)

17.85 v2.94.0 - 2022-05-18

17.85.1 Automatic Migrations

- Re-normalize the migrated properties noted in the data model updates listed below. See *Data Migration* for more information about automatic migrations.

17.85.2 Features and Enhancements

- Updates to the `crypto`, `infotech`, `ou`, and `person` models. (#2620) (#2684)

  `crypto:algorithm`
  Add a form to represent a named cryptography algorithm.

  `crypto:key`
  Add a form to represent a cryptographic key and algorithm.

  `crypto:smart:effect:transfertoken`
  Add a form to represent the effect of transferring ownership of a non-fungible token.

  `crypto:smart:effect:transfertokens`
  Add a form to represent the effect of transferring multiple fungible tokens.

  `crypto:smart:effect:edittokensupply`
  Add a form to represent the increase or decrease in the supply of fungible tokens.

  `it:prod:softname`
  Add a form to represent a software name.

  `it:host`
  Add a `:os:name` secondary property.

  `it:mitre:attack:software`
  Migrate the `:name` and `:names` properties to `it:prod:softname` type.

  `it:prod:soft`
  Migrate the `:name` and `:names` properties to `it:prod:softname` type.

  `it:prod:softver`
  Deprecate the `:software:name` property. Migrate the `:name` and `:names` properties to `it:prod:softname` type.

  `it:app:yara:rule`
  Add a `:family` property to represent the software family the rule is designed to detect.

  `it:sec:c2:config`
  Add a form to represent C2 configuration data.

  `ou:campaign`
  Add a `:org:name` property to represent the name of the organization responsible the campaign. Add a `:org:fqdn` property to represent the fqdn of the organization responsible the campaign. Add a `:team` property to represent the team responsible for the campaign.

`ou:team`
Add a form to represent a team within an organization.

`ou:industry`
Migrate the `:name` property to `ou:industryname` type. Add a `:names` property for alternative names.

`ou:industryname`
Add a form to represent the name of an industry.

`ou:position`
Add a `:team` property to represent the team associated with a given position.

`ps:contact`
Add a `:crypto:address` property to represent the crypto currency address associated with the contact.

- Add `$lib.copy()` to Storm. This allows making copies of objects which are compatible with being serialized with msgpack. (#2678)
- Remove *print* events from the Storm *limit* command. (#2674)

17.85.3 Bugfixes

- Fix an issue where client certificates presented in Telepath `ssl` connections could fallback to resolving users by a prefix. This was not intended to be allowed when client certificates are used with Telepath. (#2675)
- Fix an issue where `node:del` triggers could fail to fire when adding nodeedits directly to a view or snap. (#2654)
- Fix header escaping when generating autodoc content for Synapse Cells. (#2677)
- Assorted unit tests fixes to make tests more stable. (#2680)
- Fix an issue with Storm function argument parsing. (#2685)

17.85.4 Improved Documentation

- Add an introduction to Storm libraries and types. (#2670) (#2683)
- Fix small typos and corrections in the devops documentation. (#2673)

17.86 v2.93.0 - 2022-05-04

17.86.1 Features and Enhancements

- Updates to the `inet` and `infotech` models. (#2666)

`:sandbox:file`
Add a `sandbox:file` property to record an initial sample from a sandbox environment to the following forms:

`it:exec:proc` `it:exec:thread` `it:exec:loadlib` `it:exec:mmap` `it:exec:mutex` `it:exec:pipe` `it:exec:url` `it:exec:bind` `it:exec:file:add` `it:exec:file:del` `it:exec:file:read` `it:exec:file:write` `it:exec:reg:del` `it:exec:reg:get` `it:exec:reg:set`

`it:host:activity`
Update the interface to add a `sandbox:file` property to record an initial sample from a sandbox environment.

- Changed primary Storm parser to a LALR compatible syntax to gain 80x speed up in parsing Storm queries (#2649)
- Added service provisioning API to AHA service and associated tool `synapse.tools.aha.provision.service` and documentation to make it easy to bootstrap Synapse services using service discovery and SSL client-side certificates to identify service accounts. (#2641)
- Added user provisioning API to AHA service and associated tools `synapse.tools.aha.provision.user` and `synapse.tools.aha.enroll` to make it easy to bootstrap new users with SSL client-side certificates and AHA service discovery configuration. (#2641)
- Added automatic mirror initialization logic to Synapse services to enable new mirrors to be initilized dynamically via AHA provisioning rather than from a pre-existing backup. (#2641)
- Added `handoff()` API to Synapse services to allow mirrors to be gracefully promoted to leader. (#2641)
- Added `synapse.tools.promote` to allow easy promotion of mirror to leader using the new `handoff()` API. (#2641)
- Added `aha:provision` configuration to Synapse services to allow them to automatically provision and self-configure using AHA. (#2641)
- Adjusted Synapse service configuration preference to allow runtime settings to be stored in `cell.yaml`. (#2641)
- Added optional `certhash` parameter to telepath `ssl://` URLs to allow cert-pinning behavior and automatic trust of provisioning URLs. (#2641)
- Added `synapse.tools.moduser` and `synapse.tools.modrole` commands to modernize and ease user/role management from within Synapse service docker containers. (#2641)
- Add `$lib.jsonstor.cacheget()` and `lib.jsonstor.cacheset()` functions in Storm to easily implement data caching in the JSONStor. (#2662)
- Add a `params` option to `$lib.inet.http.connect()` to pass parameters when creating Websocket connections in Storm. (#2664)

17.86.2 Bugfixes

- Added `getCellRunId()` API to Synapse services to allow them to detect incorrect mirror configurations where they refer to themselves. (#2641)
- Ensure that CLI history files can be read and written upon starting interactive CLI tools. (#2660)
- Assorted unit tests fixes to make tests more stable. (#2656) (#2665)
- Fix several uses of Python features which are formally deprecated and may be removed in future Python versions. (#2668)

17.86.3 Improved Documentation

- Added new Deployment Guide with step-by-step production ready deployment instructions (#2641)
- Refactored Devops Guide to give task-oriented instructions on performing common devops tasks. (#2641)
- Added new minimal Admin Guide as a place for documenting Cortex admin tasks. (#2641)
- Updated Getting Started to direct users to synapse-quickstart instructions. (#2641)
- Added `easycert` tool documentation. (#2641)
- Removed `cmdr` tool documentation to emphasize newer tools such as `storm`. (#2641)

- Update the list of available Advanced and Rapid Power-Ups. (#2667)

17.87 v2.92.0 - 2022-04-28

17.87.1 Features and Enhancements

- Update the allowed versions of the `pyopenssl` and `pytz` libraries. (#2657) (#2658)

17.87.2 Bugfixes

- When setting ival properties, they are now properly merged with existing values. This only affected multi-layer views. (#2655)

17.88 v2.91.1 - 2022-04-24

17.88.1 Bugfixes

- Fix a parsing regression in inet:url nodes related to unencoded "@" symbols in URLs. (#2653)

17.89 v2.91.0 - 2022-04-21

17.89.1 Features and Enhancements

- Updates to the `inet` and `infotech` models. (#2634) (#2644) (#2652)

  `inet:url`
  The `inet:url` type now recognizes various `file:///` values from RFC 8089.

  `it:sec:cve`
  The `it:sec:cve` type now replaces various Unicode dashes with hyphen characters when norming. This allows a wider range of inputs to be accepted for the type. Scrape related APIs have also been updated to match on this wider range of inputs.

- The Cell now uses `./backup` as a default path for storing backups in, if the `backup:dir` path is not set. (#2648)
- Add POSIX advisory locking around the Cell `cell.guid` file, to prevent multiple processes from attempting to start a Cell from the same directory. (#2642)
- Change the default `SLAB_COMMIT_WARN` time from 5 seconds to 1 second, in order to quickly identify slow storage performance. (#2630)
- Change the Cell `iterBackupArchive` and `iterNewBackupArchive` routines to always log exceptions they encounter, and report the final log message at the appropriate log level for success and failure. (#2629)
- When normalizing the `str` types, when `onespace` is specified, we skip the `strip` behavior since it is redundant. (#2635)
- Log exceptions raised by Cell creation in `initFromArgv`. Catch `lmdb.LockError` when opening a LMDB database and re-raise an exception with a clear error message. (#2638)
- Update schema validation for Storm packages to ensure that cmd arguments do not have excess fields in them. (#2650)

17.89.2 Bugfixes

- Adjust comma requirements for the JSON style list and dictionary expressions in Storm. (#2636)
- Add Storm query logging in a code execution path where it was missing. (#2647)
- Tuplify the output of `synapse.tools.genpkg.loadPkgProto` to ensure that Python list constructs `[...]` do not make it into Power-Up documentation. (#2646)
- Fix an issue with heavy Stormtypes objects where caching was preventing some objects from behaving in a dynamic fashion as they were intended to. (#2640)
- In norming `int` values, when something is outside of the minimum or maximum size of the type, we now include the string representation of the valu instead of the raw value. (#2643)
- Raise a `NotReady` exception when a client attempts to resolve an `aha://` URL and there have not been any `aha` servers registered. (#2645)

17.89.3 Improved Documentation

- Update Storm command reference to add additional commands. (#2633)
- Expand Stormtypes API documentation. (#2637) (#2639)

17.90 v2.90.0 - 2022-04-04

17.90.1 Features and Enhancements

- Updates to the `meta` and `infotech` models. (#2624)

  `meta:rule`
  Add a new form for generic rules, which should be linked to the nodes they match with a `matches` light edge.

  `meta:ruleset`
  Add `:author`, `:created`, and `:updated` secondary properties.

  `it:app:yara:rule`
  Add `:created` and `:updated` secondary properties.

- Add a new Docker image `vertexproject/synapse-jsonstor`. (#2627)
- Allow passing a version requirement string to `$lib.import()`. (#2626)

17.90.2 Bugfixes

- Fix an issue where using a regex lift on an array property could incorrectly yield the same node multiple times. (#2625)

17.90.3 Improved Documentation

- Update documentation regarding mirroring to be clearer about whether a given cell supports it. (#2619)

17.91 v2.89.0 - 2022-03-31

17.91.1 Features and Enhancements

- Update the `meta` model. (#2621)

  `meta:ruleset`
  Add a new form to denote the collection of a set of nodes representing rules, which should be linked together with a `has` light edge.

- Add additional filter options for the Storm `merge` command. (#2615)
- Update the `BadSyntaxError` exception thrown when parsing Storm queries to additionally include line and column when available. Fix an issue where a `!` character being present in the exception text could truncate the output. (#2618)

17.92 v2.88.0 - 2022-03-23

17.92.1 Automatic Migrations

- Re-normalize the `geo:place:name`, `crypto:currency:block:hash`, and `crypto:currency:transaction:hash` values to account for their modeling changes. Migrate `crypto:currency:transaction:input` and `crypto:currency:transaction:output` values to the secondary properties on the respective `crypto:payment:input` and `crypto:payment:output` nodes to account for the modeling changes. Make `geo:name` nodes for `geo:place:name` secondary properties to account for the modeling changes. See *Data Migration* for more information about automatic migrations.

17.92.2 Features and Enhancements

- Several updates for the `crypto`, `geospace`, `inet`, and `meta` models. (#2594) (#2608) (#2611) (#2616)

  `crypto:payment:input`
  Add a secondary property `:transaction` to denote the transaction for the payment.

  `crypto:payment:output`
  Add a secondary property `:transaction` to denote the transaction for the payment.

  `crypto:currency:block`
  Change the type of the `:hash` property from a `0x` prefixed `str` to a `hex` type.

  `crypto:currency:transaction`
  Change the type of the `:hash` property from a `0x` prefixed `str` to a `hex` type. Deprecate the `:inputs` and `:outputs` secondary properties.

  `geo:place`
  Change the type of the `:name` secondary property to `geo:name`.

  `inet:web:channel`
  Add a new form to denote a channel within a web service or instance.

inet:web:instance
Add a new form to track an instance of a web service, such as a channel based messaging platform.

inet:web:mesg
Add `:channel`, `:place`, and `:place:name` secondary properties.

inet:web:post
Add `:channel` and `:place:name` secondary properties.

meta:event
Add a new form to denote an analytically relevant event in a curated timeline.

meta:event:taxonomy
Add a new form to represent a taxonomy of `meta:event:type` values.

meta:timeline
Add a new form to denote a curated timeline of analytically relevant events.

meta:timeline:taxonomy
Add a new form to represent a taxonomy of `meta:timeline:type` values.

- Add support for `$lib.len()` to count the length of emitter or generator functions. (#2603)
- Add support for scrape APIs to handle text that has been defanged with `\\.` characters. (#2605)
- Add a `nomerge` option to View objects that can be set to prevent merging a long lived fork. (#2614)
- Add `liftByProp()` and `liftByTag()` methods to the Stormtypes `layer` objects. These allow lifting of nodes based on data stored in a specific layer. (#2613)
- Expand Synapse requirements to include updated versions of the `pygments` library. (#2602)

17.92.3 Improved Documentation

- Fix the example regular expressions used in the `$lib.scrape.genMatches()` Storm library API examples. (#2606)

17.93 v2.87.0 - 2022-03-18

17.93.1 Features and Enhancements

- Several updates for the `inet` and `meta` models. (#2589) (#2592)

  inet:ssl:jarmhash
  Add a form to record JARM hashes.

  inet:ssl:jarmsample
  Add a form to record JARM hashes being present on a server.

  meta:note
  Add a form for recording free text notes.

- Update the Synapse docker containers to be built from a Ubuntu based image, instead of a Debian based image. (#2596)
- Add a Storm `note.add` command that creates a `meta:note` node to record freeform text, and links that node to the input nodes using a `about` light edge. (#2592)
- Support non-writeable or non-existing directories within Synapse `certdir` directories. (#2590)

- Add an optional `tick` argument to the `synapse.lib.lmdbslab.Hist.add()` function. This is exposed internally for Axon implementations to use. (#2593)
- Expand Synapse requirements to include updated versions of the `pycryptome`, `pygments`, `scalecodec` and `xxhash` modules. (#2598)

17.93.2 Bugfixes

- Fix an issue where the StormDmon stop/start status was not properly being updated in the runtime object, despite being properly updated in the Hive. (#2598)
- Calls to `addUnivProp()` APIs when the universal property name already exists now raise a `DupPropName` exception. (#2601)

17.94 v2.86.0 - 2022-03-09

17.94.1 Automatic Migrations

- Migrate secondary properties in Cortex nodes which use `hugenum` type to account for updated ranges. See *Data Migration* for more information about automatic migrations.

17.94.2 Features and Enhancements

- Extend the number of decimal places the `hugenum` type can store to 24 places, with a new maximum value of 730750818665451459101842. (#2584) (#2586)
- Update `fastjsonschema` to version `2.15.3`. (#2581)

17.94.3 Bugfixes

- Add missing read-only flags to secondary properties of Comp type forms which were computed from the primary property of the node. This includes the following: (#2587)
  - `crypto:currency:address:coin`
  - `crypto:currency:address:iden`
  - `crypto:currency:block:coin`
  - `crypto:currency:block:offset`
  - `crypto:currency:client:coinaddr`
  - `crypto:currency:client:inetaddr`
  - `crypto:currency:smart:token:contract`
  - `crypto:currency:smart:token:tokenid`
  - `crypto:x509:revoked:crl`
  - `crypto:x509:revoked:cert`
  - `crypto:x509:signedfile:cert`
  - `crypto:x509:signedfile:file`

  - `econ:acquired:item`
  - `econ:acquired:purchase`
  - `inet:dns:query:client`
  - `inet:dns:query:name`
  - `inet:dns:query:type`
  - `inet:whois:contact:type`
  - `inet:wifi:ap:bssid`
  - `inet:wifi:ap:ssid`
  - `mat:itemimage:file`
  - `mat:itemimage:item`
  - `mat:specimage:file`
  - `mat:specimage:spec`
  - `ou:id:number:type`
  - `ou:id:number:value`
  - `ou:hasgoal:goal`
  - `ou:hasgoal:org`
  - `tel:mob:cell:carrier`
  - `tel:mob:cell:carrier:mcc`
  - `tel:mob:cell:carrier:mnc`
  - `tel:mob:cell:cid`
  - `tel:mob:cell:lac`
- Fix an issue where Layers configured with writeback mirrors did not properly handle results which did not have any changes. (#2583)

17.94.4 Improved Documentation

- Fix spelling issues in documentation and API docstrings. (#2582) (#2585)

17.95 v2.85.1 - 2022-03-03

17.95.1 Bugfixes

- Fix a permission enforcement issue in autoadd mode that allowed users with view read permissions to add automatically detected and validated nodes but make no further edits. (#2579)
- Log errors encountered in the Layer mirror loop which don't have a local caller waiting on the change. (#2580)

17.96 v2.85.0 - 2022-03-03

17.96.1 Features and Enhancements

- Several updates for the `crypto`, `geo`, `inet`, `it`, `ps` and `risk` models. (#2570) (#2573) (#2574)

  `crypto:payment:input`
  : Add a new form to record payments made into a transaction.

  `crypto:payment:output`
  : Add a new form to record payments receieved from a transaction.

  `crypto:currency:transaction`
  : Add `inputs` and `outputs` array secondary properties to record inputs and outputs for a given transaction.

  `geo:name`
  : Add a new form representing an unstructured place name or address.

  `geo:place`
  : Add a `names` secondary property which is an array of `geo:name` values.

  `inet:flow`
  : Add `dst:txcount`, `src:txcount`, `tot:txcount` and `tot:txbytes` secondary properties.

  `it:exec:proc`
  : Add an `account` secondary property as a `it:account` type. Mark the `user` secondary property as deprecated.

  `ps:contact`
  : Add `birth:place`, `birth:place:loc`, `birth:place:name`, `death:place`, `death:place:loc` and `death:place:name` secondary properties.

  `risk:compromise`
  : Add a `theft:price` secondary property to represent value of stolen assets.

- Embed Cron, StormDmon, and Trigger iden values and automation types into the Storm runtime when those automations are run. This information is populated in a dictionary variable named `$auto`. (#2565)
- Add `$lib.crypto.coin.ethereum.eip55()` to convert an Ethereum address to a checksummed address. (#2577)
- Add a `default` argument to the `$lib.user.allowed()` and `allowed()` method on `user` StormType. (#2570)
- Add a `inaugural` configuration key to the base `Cell` class. This can currently be used to bootstrap roles, permissions, and users in a Cell upon the first time it is started. (#2570)
- De-duplicate nodes when running the Storm `lookup` mode to lift nodes. (#2567)
- Add a test helper that can be used to isolate the `synapse.lib.certdir.certdir` singleton behavior via context manager. (#2564)

17.96.2 Bugfixes

- Calls to `addFormProp()` APIs when the property name already exists now raise a `DupPropName` exception. (#2566)
- Do not allow Storm `macro`'s to be created that have names greater than 492 characters in length. (#2569)
- Fix a bug in the scrape logic for Ethereum where the regular expression matched on `0X` prefixed strings but the validation logic did not account for that uppercase character. (#2575)

17.96.3 Improved Documentation

- Add documentation for the `$auto` variable embedded into the Cron, StormDmon, and Trigger automations. Add documentation for variables representing the form, node value, properties and tags which are responsible for Triggers running. (#2565)

17.97 v2.84.0 - 2022-02-22

17.97.1 Features and Enhancements

- Add `$lib.time.toUTC()` to adjust a local epoch milliseconds time to UTC. (#2550)
- Add a optional `timeout` argument to `$lib.service.wait()`. The function now returns `$lib.true` if the service is available, or `$lib.false` if the service does not become available during the timeout window. (#2561)
- Update the `Layer.verify()` routines to add verification of tagprop and array indexes in layers. These routines are in a beta status and are subject to change. (#2560)
- Update the Cortex's connection to a remote Axon to use a Telepath Client. (#2559)

17.98 v2.83.0 - 2022-02-17

17.98.1 Features and Enhancements

- Add `:ip:proto` and `:ip:tcp:flags` properties to the `inet:flow` form. (#2554)
- Add `$lib.log.debug()`, `$lib.log.info()`, `$lib.log.warning()`, and `$lib.log.error()` Stormtypes APIs. These allow a user to send log messages to the Cortex logging output directly.
- Update the `synapse.tools.genpkg` tool to support using files with the `.storm` extension. This is enabled by adding the following option to a Storm package definition. (#2555)

```
genopts:
  dotstorm: true
```

- Add form and prop values to `BadTypeValu` exceptions when raised during node edit generation. (#2552)

17.98.2 Bugfixes

- Correct a race condition in the `CoreApi.syncLayersEvents` and `CoreApi.syncIndexEvents` APIs. (#2553)

17.98.3 Improved Documentation

- Remove outdated documentation related to making `CoreModule` classes. (#2556)

17.99 v2.82.1 - 2022-02-11

17.99.1 Bugfixes

- Re-order node edit validation to only check read-only status of properties if the value would change. (#2547)
- Raise the correct exception when parsing invalid time values, like `0000-00-00`. (#2548)
- Disable node caching for `StormDmon` runtimes to avoid potential cache coherency issues. (#2549)

17.100 v2.82.0 - 2022-02-10

17.100.1 Features and Enhancements

- Add an `addNode()` API to the Stormtypes `view` object. This allows the programmatic creation of a node with properties being set in a transactional fashion. (#2540)
- Add support to Storm for creating JSON style list and dictionary objects. (#2544)
- The `AhaCell` now bootstraps TLS CA certificates for the configured `aha:network` value, a host certificate for the `aha:name` value, and a user certificate for the `aha:admin` value. (#2542)
- Add `mesg` arguments to all exceptions raised in `synapse.lib.certdir`. (#2546)

17.100.2 Improved Documentation

- Fix some missing and incorrect docstrings for Stormtypes. (#2545)

17.100.3 Deprecations

- Telepath APIs and Storm commands related to `splices` have been marked as deprecated. (#2541)

17.101 v2.81.0 - 2022-01-31

17.101.1 Features and Enhancements

- The `it:sec:cpe` now recognizes CPE 2.2 strings during type normalization. CPE 2.2 strings will be upcast to CPE 2.3 and the 2.2 string will be added to the `:v2_2` secondary property of `it:sec:cpe`. The Storm hotfix `$lib.cell.hotFixesApply()` can be used to populate the `:v2_2` property on existing `it:sec:cpe` nodes where it is not set. (#2537) (#2538) (#2539)
- Setting properties on nodes may now take a fast path if the normed property has no subs, no autoadds and is not a locked property. (#2539)

17.101.2 Bugfixes

- Fix an issue with `Ival` `norm()` routines when norming a tuple or list of values. The max value returned previously could have exceeded the value of the future marker `?`, which would have been then caused an a `BadTypeValu` exception during node edit construction. This is is now caught during the initial `norm()` call. (#2539)

17.102 v2.80.1 - 2022-01-26

17.102.1 Bugfixes

- The embedded JsonStor added to the Cortex in `v2.80.0` needed to have a stable iden for the Cell and and auth subsystem. This has been added. (#2536)

17.103 v2.80.0 - 2022-01-25

17.103.1 Features and Enhancements

- Add a triple quoted string `'''` syntax to Storm for defining multiline strings. (#2530)
- Add a JSONStor to the Cortex, and expose that in Storm for storing user related content. (#2530) (#2513)
- Add durable user notifications to Storm that can be used to send and receive messages between users. (#2513)
- Add a `leaf` argument to `$node.tags()` that causes the function to only return the leaf tags. (#2535)
- Add an error message in the default help text in pure Storm commands when a user provides additional arguments or switches, in addition to the `--help` switch. (#2533)
- Update `synapse.tools.genpkg` to automatically bundle Optic workflows from files on disk. (#2531)
- Expand Synapse requirements to include updated versions of the `packaging`, `pycryptome` and `scalecodec` modules. (#2534)

17.103.2 Bugfixes

- Add a missing `tostr()` call to the Storm `background` query argument. (#2532)

17.104 v2.79.0 - 2022-01-18

17.104.1 Features and Enhancements

- Add `$lib.scrape.ndefs()` and `$lib.scrape.context()` to scrape text. The `ndefs()` API yields a unique set of node form and value pairs, while the `context()` API yields node form, value, and context information for all matches in the text. (#2508)
- Add `:name` and `:desc` properties to the `it:prod:softver` form. (#2528)
- Update the `Layer.verify()` routines to reduce false errors related to array types. The method now takes a dictionary of configuration options. These routines are in a beta status and are subject to change. (#2527)
- Allow setting a View's parent if does not have an existing parent View and only has a single layer. (#2515)
- Add `hxxp[:\\]` and `hxxps[:\\]` to the list of known defanging strategies which are identified and replaced during text scraping. (#2526)
- Expand Synapse requirements to include updated versions of the `typing-extensions` module. (#2525)

17.104.2 Bugfixes

- Storm module interfaces now populate `modconf` data when loaded. (#2508)
- Fix a missing keyword argument from the `AxonApi.wput()` method. (#2527)

17.104.3 Deprecations

- The `$lib.scrape()` function has been deprecated in favor the new `$lib.scrape` library functions. (#2508)

17.105 v2.78.0 - 2022-01-14

17.105.1 Automatic Migrations

- Migrate Cortex nodes which may have been skipped in an earlier migration due to missing tagprop indexes. See *Data Migration* for more information about automatic migrations.

17.105.2 Features and Enhancements

- Expand Synapse requirements to include updated versions of the `base58`, `cbor2`, `lmdb`, `pycryptodome`, `PyYAML`, `xxhash`. (#2520)

17.105.3 Bugfixes

- Fix an issue with the Tagprop migration from `v2.42.0` where a missing index could have resulted in Layer storage nodes not being updated. (#2522) (#2523)
- Fix an issue with `synapse.lib.platforms.linux.getTotalMemory()` when using a process segregated with the Linux cgroups2 API. (#2517)

17.105.4 Improved Documentation

- Add devops instructions related to automatic data migrations for Synapse components. (#2523)
- Update the model deprecation documentation for the `it:host:model` and `it:host:make` properties. (#2521)

17.106 v2.77.0 - 2022-01-07

17.106.1 Features and Enhancements

- Add Mach-O metadata support the file model. This includes the following new forms: `file:mime:macho:loadcmd`, `file:mime:macho:version`, `file:mime:macho:uuid`, `file:mime:macho:segment`, and `file:mime:macho:section`. (#2503)
- Add `it:screenshot`, `it:prod:hardware`, `it:prod:component`, `it:prod:hardwaretype`, and `risk:mitigation` forms to the model. Add `:hardware` property to `risk:hasvuln` form. Add `:hardware` property to `it:host` form. The `:manu` and `:model` secondary properties on `it:host` have been deprecated. (#2514)
- The `guid` type now strips hyphen (`-`) characters when doing norm. This allows users to provide external UUID / GUID strings for use. (#2514)
- Add a `Axon.postfiles()` to allow POSTing files as multi-part form encoded files over HTTP. This is also exposed through the `fields` argument on the Storm `$lib.inet.http.post()` and `$lib.inet:http:request` APIs. (#2516)
- Add `.yu` ccTLD to the list of TLDs identified by the Synapse scrape functionality. (#2518)
- Add `mesg` arguments to all instances of `NoSuchProp` exceptions. (#2519)

17.107 v2.76.0 - 2022-01-04

17.107.1 Features and Enhancements

- Add `emit` and `stop` keywords to Storm. The `emit` keyword is used in functions to make them behave as generators, which can yield arbitrary values. The `stop` keyword can be used to prematurely end a function which is `emit`'ing values. (#2475)

- Add Storm Module Interfaces. This allows Storm Package authors to define common module interfaces, so that multiple modules can implement the API convention to provide a consistent set of data across multiple Storm modules. A `search` convention is added to the Cortex, which will be used in `lookup` mode when the `storm:interface:search` configuration option is set. (#2475)
- Storm queries in `lookup` mode now fire `look:miss` events into the Storm message stream when the lookup value contains a valid node value, but the node is not present in the current View. (#2475)
- Add a `:host` secondary property to `risk:hasvuln` form to record `it:host` instances which have a vulnerability. (#2512)
- Add `synapse.lib.scrape` support for identifying `it:sec:cve` values. (#2509)

17.107.2 Bugfixes

- Fix an `IndexError` that can occur during `Layer.verify()` routines. These routines are in a beta status and are subject to change. (#2507)
- Ensure that parameter and header arguments passed to Storm `$lib.inet.http` functions are cast into strings values. (#2510)

17.108 v2.75.0 - 2021-12-16

This release contains an automatic data migration that may cause additional startup time on the first boot. This is done to unique array properties which previously were not uniqued. Deployments with startup or liveliness probes should have those disabled while this upgrade is performed to prevent accidental termination of the Cortex process. Please ensure you have a tested backup available before applying this update.

17.108.1 Features and Enhancements

- Update the following array properties to be unique sets, and add a data model migration to update the data at rest: (#2469)
  - `biz:rfp:requirements`
  - `crypto:x509:cert:ext:sans`
  - `crypto:x509:cert:ext:crls`
  - `crypto:x509:cert:identities:fqdns`
  - `crypto:x509:cert:identities:emails`
  - `crypto:x509:cert:identities:ipv4s`
  - `crypto:x509:cert:identities:ipv6s`
  - `crypto:x509:cert:identities:urls`
  - `crypto:x509:cert:crl:urls`
  - `inet:whois:iprec:contacts`
  - `inet:whois:iprec:links`
  - `inet:whois:ipcontact:roles`
  - `inet:whois:ipcontact:links`
  - `inet:whois:ipcontact:contacts`

  - `it:account:groups`
  - `it:group:groups`
  - `it:reveng:function:impcalls`
  - `it:reveng:filefunc:funccalls`
  - `it:sec:cve:references`
  - `risk:vuln:cwes`
  - `tel:txtmesg:recipients`

- Add Layer index verification routines, to compare the Layer indices against the stored data for Nodes. This is exposed via the `.verify()` API on the Stormtypes `layer` object. These routines are in a beta status and are subject to change. (#2488)
- The `.json()` API on `inet:http:resp` now raises a `s_exc.BadJsonText` exception, which can be caught with the Storm `try ... catch` syntax. (#2500)
- Add `$lib.inet.ipv6.expand()` to expand an IPv6 address to its long form. (#2502)
- Add `hasPathObj()`, `copyPathObj()` and `copyPathObjs()` APIs to the `JsonStor`. (#2438)
- Allow setting a custom title when making documentation for Cell `confdefs` with the `synapse.tools.autodoc` tool. (#2504)
- Update the minimum version of the `aiohttp` library to `v3.8.1`. (#2495)

17.108.2 Improved Documentation

- Add content previously hosted at `commercial.docs.vertex.link` to the mainline Synapse documentation. This includes some devops information related to orchestration, information about Advanced and Rapid Power-Ups, information about the Synapse User Interface, as well as some support information. (#2498) (#2499) (#2501)
- Add `Synapse-Malshare` and `Synapse-TeamCymru` Rapid Power-Ups to the list of available Rapid Power-Ups. (#2506)
- Document the `jsonlines` option for the `api/v1/storm` and `api/v1/storm/nodes` HTTP APIs. (#2505)

17.109 v2.74.0 - 2021-12-08

17.109.1 Features and Enhancements

- Add `.onion` and `.bit` to the TLD list used for scraping text. Update the TLD list from the latest IANA TLD list. (#2483) (#2497)
- Add support for writeback mirroring of layers. (#2463) (#2489)
- Add `$lib.scrape()` Stormtypes API. This can be used to do programmatic scraping of text using the same regular expressions used by the Storm `scrape` command and the `synapse.lib.scrape` APIs. (#2486)
- Add a `jsonlines` output mode to Cortex streaming HTTP endpoints. (#2493)
- Add a `--raw` argument to the Storm `pkg.load` command. This loads the raw JSON response as a Storm package. (#2491)
- Add a `blocked` enum to the `proj:ticket:status` property to represent a blocked ticket. (#2490)

17.109.2 Bugfixes

- Fix a behavior with `$path` losing variables in pure Storm command execution. (#2492)

17.109.3 Improved Documentation

- Update the description of the Storm `scrape` command. (#2494)

17.110 v2.73.0 - 2021-12-02

17.110.1 Features and Enhancements

- Add a Storm `runas` command. This allows admin users to execute Storm commands as other users. (#2473)
- Add a Storm `intersect` command. This command produces the intersection of nodes emitted by running a Storm query over all inbound nodes to the `intersect` command. (#2480)
- Add `wait` and `timeout` parameters to the `Axon.hashes()` and `$lib.axon.list()` APIs. (#2481)
- Add a `readonly` flag to `synapse.tools.genpkg.loadPkgProto()` and `synapse.tools.genpkg.tryLoadPkgProto()` APIs. If set to `True` this will open files in read only mode. (#2485)
- Allow Storm Prim objects to be capable of directly yielding nodes when used in `yield` statements. (#2479)
- Update the StormDmon subsystem to add debug log information about state changes, as well as additional data for structured logging output. (#2455)

17.110.2 Bugfixes

- Catch a fatal application error that can occur in the Cortex if the forked process pool becomes unusable. Previously this would cause the Cortex to appear unresponsive for executing Storm queries; now this causes the Cortex to shut down gracefully. (#2472)
- Fix a Storm path variable scoping issue where variables were improperly scoped when nodes were passed into pure Storm commands. (#2459)

17.111 v2.72.0 - 2021-11-23

17.111.1 Features and Enhancements

- Update the cron subsystem logs to include the cron name, as well as adding additional data for structured logging output. (#2477)
- Add a `sort_keys` argument to the `$lib.yaml.save()` Stormtype API. (#2474)

17.111.2 Bugfixes

- Update the `asyncio-socks` version to a version which has a pinned version range for the `python-socks` dependency. (#2478)

17.112 v2.71.1 - 2021-11-22

17.112.1 Bugfixes

- Update the `PyOpenSSL` version to `21.0.0` and pin a range of modern versions of the `cryptography` which have stronger API compatibility. This resolves an API compatibility issue with the two libraries which affected SSL certificate generation. (#2476)

17.113 v2.71.0 - 2021-11-19

17.113.1 Features and Enhancements

- Add support for asynchronous triggers. This mode of trigger operation queues up the trigger event in the View for eventual processing. (#2464)
- Update the crypto model to add a `crypto:smart:token` form to represent a token managed by a smart contract. (#2462)
- Add `$lib.axon.readlines()` and `$lib.axon.jsonlines()` to Stormtypes. (#2468)
- Add the Storm `mode` to the structured log output of a Cortex executing a Storm query. (#2466)

17.113.2 Bugfixes

- Fix an error when converting Lark exceptions to Synapse `BadSyntaxError`. (#2471)

17.113.3 Improved Documentation

- Revise the Synapse documentation layout. (#2460)
- Update type specific behavior documentation for `time` types, including the recently added wildcard time syntax. (#2467)
- Sort the Storm Type documentation by name. (#2465)
- Add 404 handler pages to our documentation. (#2461) (#2470)

17.113.4 Deprecations

- Remove `$path.trace()` objects. (#2445)

17.114 v2.70.1 - 2021-11-08

17.114.1 Bugfixes

- Fix an issue where `$path.meta` data was not being properly serialized when heavy Stormtype objects were set on the `$path.meta` dictionary. (#2456)
- Fix an issue with Stormtypes `Str.encode()` and `Bytes.decode()` methods when handling potentially malformed Unicode string data. (#2457)

17.114.2 Improved Documentation

- Update the Storm Control Flow documentation with additional examples. (#2443)

17.115 v2.70.0 - 2021-11-03

17.115.1 Features and Enhancements

- Add `:dst:handshake` and `src:handshake` properties to `inet:flow` to record text representations of the handshake strings of a given connection. (#2451)
- Add a `proj:attachment` form to the `project` model to represent attachments to a given `proj:ticket`. (#2451)
- Add a implicit wildcard behavior to the `time` type when lifting or filtering nodes. Dates ending in a `*` are converted into ranges covering all possible times in them. For example, `.created=202101*` would lift all nodes created on the first month of 2021. (#2446)
- Add the following `$lib.time` functions to chop information from a time value. (#2446)
  - `$lib.time.year()`
  - `$lib.time.month()`
  - `$lib.time.day()`
  - `$lib.time.hour()`
  - `$lib.time.minute()`
  - `$lib.time.second()`
  - `$lib.time.dayofweek()`
  - `$lib.time.dayofmonth()`
  - `$lib.time.monthofyear()`
- Add `List.extend()`, `List.slice()`, `Str.find()`, and `Str.size()` functions to Stormtypes. (#2450) (#2451)
- Add `$lib.json.schema()` and a `json:schema` object to Stormtypes. These can be used to validate arbitrary data JSON structures in Storm using JSON Schema. (#2448)

- Update syntax checking rules and address deprecation warnings for strings in the Synapse codebase. (#2426)

17.116 v2.69.0 - 2021-11-02

17.116.1 Features and Enhancements

- Add support for building Optic Workflows for Storm Packages in the `synapse.tools.genpkg` tool. (#2444)
- The `synapse.tools.storm` CLI tool now prints out node properties in precedence order. (#2449)
- Update the global Stormtypes registry to better track types when they are added or removed. (#2447)

17.117 v2.68.0 - 2021-10-29

17.117.1 Features and Enhancements

- Add `crypto:currency:transaction`, `crypto:currency:block`, `crypto:smart:contract` and `econ:acct:balanc` forms. (#2423)
- Add `$lib.hex.decode()` and `$lib.hex.encode()` Stormtypes functions to encode and decode hexidecimal data as bytes. Add `slice()` and `unpack()` methods to the Storm Bytes object. (#2441)
- Add `$lib.yaml` and `$lib.xml` Stormtypes libraries for interacting with YAML and XML text, respectively. (#2434)
- Add a Storm `version` command to show the user the current version of Synapse the Cortex is using. (#2440)

17.117.2 Bugfixes

- Fix overzealous `if` statement caching in Storm. (#2442)

17.118 v2.67.0 - 2021-10-27

17.118.1 Features and Enhancements

- Add `$node.addEdge()` and `$node.delEdge()` APIs in Storm to allow for programatically setting edges. Add a `reverse` argument to `$node.edges()` that allows traversing edges in reverse. (#2351)

17.118.2 Bugfixes

- Fix a pair of regressions related to unicode/IDNA support for scraping and normalizing FQDNs. (#2436)

17.118.3 Improved Documentation

- Add documentation for the Cortex `api/v1/storm/call` HTTP API endpoint. (#2435)

17.119 v2.66.0 - 2021-10-26

17.119.1 Features and Enhancements

- Improve unicode/IDNA support for scraping and normalizing FQDNs. (#2408)
- Add `$lib.inet.http.ouath` to support OAuth based workflows in Storm, starting with OAuth v1.0 support. (#2413)
- Replace `pysha3` requirement with `pycryptodome`. (#2422)
- Add a `tls:ca:dir` configuration option to the Cortex and Axon. This can be used to provide a directory of CA certificate files which are used in Storm HTTP API and Axon wget/wput APIs. (#2429)

17.119.2 Bugfixes

- Catch and raise bad ctors given in RStorm `storm-cortex` directives. (#2424)
- Fix an issue with the `cron.at` command not properly capturing the current view when making the Cron job. (#2425)
- Disallow the creation of extended properties, universal properties, and tag properties which are not valid properties in the Storm grammar. (#2428)
- Fix an issue with `$lib.guid()` missing a `toprim()` call on its input. (#2421)

17.119.3 Improved Documentation

- Update our Cell devops documentation to note how to replace the TLS keypair used by the built in webserver with third party certificates. (#2432)

17.120 v2.65.0 - 2021-10-16

17.120.1 Features and Enhancements

- Add support for interacting with IMAP email servers though Storm, using the `$lib.inet.imap.connect()` function. This returns a object that can be used to delete, read, and search emails in a given IMAP mailbox. (#2399)
- Add a new Storm command, `once`. This command can be used to 'gate' a node in a Storm pipeline such that the node only passes through the command exactly one time for a given named 'gate'. The gate information is stored in nodedata, so it is inspectable and subject to all other features that apply to nodedata. (#2404)
- Add a `:released` property to `it:prod:softver` to record when a software version was released. (#2419)
- Add a `tryLoadPkgProto` convenience function to the `synapse.tools.genpkg` for Storm service package generation with inline documentation. (#2414)

17.120.2 Bugfixes

- Add `asyncio.sleep(0)` calls in the `movetag` implementation to address some possible hot-loops. (#2411)
- Clarify and sanitize URLS in a Aha related log message i `synapse.telepath`. (#2415)

17.120.3 Improved Documentation

- Update our `fork` definition documentation. (#2409)
- Add documentation for using client-side TLS certificates in Telepath. (#2412)
- Update the Storm CLI tool documentation. (#2406)
- The Storm types and Storm library documentation now automatically links from return values to return types. (#2410)

17.121 v2.64.1 - 2021-10-08

17.121.1 Bugfixes

- Add a retry loop in the base `Cell` class when attempting to register with an `Aha` server. (#2405)
- Change the behavior of `synapse.common.yamlload()` to not create files when the expected file is not present on disk, and open existing files in read-only mode. (#2396)

17.122 v2.64.0 - 2021-10-06

17.122.1 Features and Enhancements

- Add support for scraping the following cryptocurrency addresses to the `synapse.lib.scrape` APIs and Storm `scrape` command. (#2387) (#2401)
  - Bitcoin
  - Bitcoin Cash
  - Ethereum
  - Ripple
  - Cardano
  - Polkadot

  The internal cache of regular expressions in the `synapse.lib.scrape` library is also now a private member; API users should use the `synapse.lib.scrape.scrape()` function moving forward.
- Add `:names` property to the `it:mitre:attack:software` form. (#2397)
- Add a `:desc` property to the `inet:whois:iprec` form. (#2392)
- Added several new Rstorm directives. (#2359) (#2400)
  - `storm-cli` - Runs a Storm query with the Storm CLI tool
  - `storm-fail` - Toggles whether or not the following Storm command should fail or not.

- storm-multiline - Allows embedding a multiline Storm query as a JSON encoded string for future execution.
- storm-vcr-callback - Allows specifying a custom callback which a VCR object is sent too.

17.122.2 Bugfixes

- Fix a missing toprim() call when loading a Storm package directly with Storm. (#2359)
- Fix a caching issue where tagprops were not always being populated in a Node tagprop dictionary. (#2396)
- Add a mesg argument to a few NoSuchVar and BadTypeValu exceptions. (#2403)

17.122.3 Improved Documentation

- Storm reference docs have been converted from Jupyter notebook format to Synapse .rstorm format, and now display examples using the Storm CLI tool, instead of the Cmdr CLI tool. (#2359)

17.123 v2.63.0 - 2021-09-29

17.123.1 Features and Enhancements

- Add a risk:attacktype taxonomy to the risk model. Add :desc and :type properties to the risk:attack form. (#2386)
- Add :path property to the it:prod:softfile form. (#2388)

17.123.2 Bugfixes

- Fix the repr for the``auth:user`` Stormtype when printing a user object in Storm. (#2383)

17.124 v2.62.1 - 2021-09-22

17.124.1 Bugfixes

- Fix an issue in the Nexus log V1 to V2 migration code which resulted in LMDB file copies being made instead of having directories renamed. This can result in a sparse file copy of the Nexus log, resulting in a condition where the volume containing the Cell directory may run out of space. (#2374)

17.125 v2.62.0 - 2021-09-21

17.125.1 Features and Enhancements

- Add APIs to support trimming, rotating and culling Nexus logs from Cells with Nexus logging enabled. These operations are distributed to downstream consumers, of the Nexus log (e.g. mirrors). For the Cortex, this can be invoked in Storm with the `$lib.cell.trimNexsLog()` Stormtypes API. The Cortex devops documentation contains more information about Nexus log rotation. (#2339) (#2371)
- Add `.size()` API to the Stormtypes `storm:query` object. This will run the query and return the number of nodes it would have yielded. (#2363)

17.125.2 Improved Documentation

- Document the tag glob meanings on the Stormtypes `$node.tags()` API. (#2368)

17.126 v2.61.0 - 2021-09-17

17.126.1 Features and Enhancements

- Add a `!export` command to the Storm CLI to save query results to a `.nodes` file. (#2356)
- Add `$lib.cell.hotFixesCheck()` and `$lib.cell.hotFixesApply()` Stormtypes functions. These can be used to apply optional hotfixes to a Cortex on demand by an admin. (#2348)
- Add `$lib.infosec.cvss.calculateFromProps()` to allow calculating a CVSS score from a dictionary of CVSS properties. (#2353)
- Add `$node.data.has()` API to Stormtypes to allow easy checking if a node has nodedata for a given name. (#2350)

17.126.2 Bugfixes

- Fix for large return values with `synapse.lib.coro.spawn()`. (#2355)
- Fix `synapse.lib.scrape.scrape()` capturing various common characters used to enclose URLs. (#2352)
- Ensure that generators being yielded from are always being closed. (#2358)
- Fix docstring for `str.upper()` in Stormtypes. (#2354)

17.126.3 Improved Documentation

- Add link to the Power-Ups blog post from the Cortex dev-ops documentation. (#2357)

17.127 v2.60.0 - 2021-09-07

17.127.1 Features and Enhancements

- Add new `risk:compromise` and `risk:compromisetype` forms. Add `attacker`, `compromise`, and `target` secondary properties to the `risk:attack` form. (#2348)

17.127.2 Bugfixes

- Add a missing `wait()` call when calling the `CoreApi.getAxonUpload()` and `CoreApi.getAxonBytes()` Telepath APIs. (#2349)

17.127.3 Deprecations

- Deprecate the `actor:org`, `actor:person`, `target:org` and `target:person` properties on `risk:attack` in favor of new `attacker` and `target` secondary properties. Deprecate the `type` property on `ou:campaign` in favor of the `camptype` property. (#2348)

17.128 v2.59.0 - 2021-09-02

17.128.1 Features and Enhancements

- Add a new Storm command, `pkg.docs`, to enumerate any documentation that has been bundled with a Storm package. (#2341)
- Add support for manipulating `'proj:comment` nodes via Stormtypes. (#2345)
- Add `Axon.wput()` and `$lib.axon.wput()` to allow POSTing a file from an Axon to a given URL. (#2347)
- Add `$lib.export.toaxon()` to allow exporting a `.nodes` file directly to an Axon based on a given storm query and opts. (#2347)
- The `synapse.tools.feed` tool now accepts a `--view` argument to feed data to a specific View. (#2342)
- The `synapse.tools.feed` tool now treats `.nodes` files as msgpack files for feeding data to a Cortex. (#2343)
- When the Storm `help` command has an argument without any matching commands, it now prints a helpful message. (#2338)

17.128.2 Bugfixes

- Fix a caching issue between `$lib.lift.byNodeData()` and altering the existing node data on a given node. (#2344)
- Fix an issue with backups were known lmdbslabs could be omitted from being treated as lmdb databases, resulting in inefficient file copies being made. (#2346)

17.129 v2.58.0 - 2021-08-26

17.129.1 Features and Enhancements

- Add `!pushfile`, `!pullfile`, and `!runfile` commands to the `synapse.tools.storm` tool. (#2334)
- Add multiname SNI support to `ssl://` listening configurations for the Daemon. (#2336)
- Add a new Cortex HTTP API Endpoint, `/api/v1/feed`. This can be used to add nodes to the Cortex in bulk. (#2337)
- Refactor the `syn.nodes` feed API implementation to smooth out the ingest rate. (#2337)
- Sort the Storm Package commands in documentation created by `synpse.tools.autodoc` alphabetically. (#2335)

17.129.2 Deprecations

- Deprecate the `syn.splices` and `syn.nodedata` feed API formats. (#2337)

17.130 v2.57.0 - 2021-08-24

17.130.1 Features and Enhancements

- Add a basic `synapse.tools.storm` CLI tool. This can be used to connect to a Cortex via Telepath and directly execute Storm commands. (#2332)
- Add an `inet:http:session` form to track the concept of a prolonged session a user may have with a webserver across multiple HTTP requests. Add an `:success` property to the ``ou:campaign` form to track if a campaign was sucessful or not. Add an `:goal` property to the `risk:attack` form to track the specific goal of the attack. Add an `:desc` property to the `proj:project` form to capture a description of the project. (#2333)

17.130.2 Bugfixes

- Fix an issue with `synapse.lib.rstorm` where multiline node properties could produce RST which did not render properly. (#2331)

17.130.3 Improved Documentation

- Clean up the documentation for the Storm `wget` command. (#2325)

17.131 v2.56.0 - 2021-08-19

17.131.1 Features and Enhancements

- Refactor some internal Axon APIs for downstream use. (#2330)

17.131.2 Bugfixes

- Resolve an ambiguity in the Storm grammar with yield statement and dollar expressions inside filter expression. There is a slight backwards incompatibility with this change, as dollar expressions insider of filter expressions now require a `$` prepended where before it was optional. (#2322)

17.132 v2.55.0 - 2021-08-18

17.132.1 Features and Enhancements

- Add `$node.props.set()` Stormtypes API to allow programmatically setting node properties. (#2324)
- Deny non-runtsafe invocations of the following Storm commands: (#2326)
  - `graph`
  - `iden`
  - `movetag`
  - `parallel`
  - `tee`
  - `tree`
- Add a `Axon.hashset()` API to get the md5, sha1, sha256 and sha512 hashes of file in the Axon. This is exposed in Stormtypes via the `$lib.bytes.hashset()` API. (#2327)
- Add the `synapse.servers.stemcell` server and a new Docker image, `vertexproject/synaspe-stemcell`. The Stemcell server is similar to the `synapse.servers.cell` server, except it resolves the Cell ctor from the `cell:ctor` key from the `cell.yaml` file, or from the `SYN_STEM_CELL_CTOR` environment variable. (#2328)

17.133 v2.54.0 - 2021-08-05

17.133.1 Features and Enhancements

- Add `storm-envvar` directive to RST preprocessor to include environment variables in `storm-pre` directive execution context. (#2321)
- Add new `diff` storm command to allow users to easily lift the set of nodes with changes in the top layer of a forked view. Also adds the `--no-tags` option to the `merge` command to allow users to omit `tag:add` node edits and newly constructed `syn:tag` nodes when merging selected nodes. (#2320)
- Adds the following properties to the data model: (#2319)
  - `biz:deal:buyer:org`

  - biz:deal:buyer:orgname
  - biz:deal:buyer:orgfqdn
  - biz:deal:seller:org
  - biz:deal:seller:orgname
  - biz:deal:seller:orgfqdn
  - biz:prod:madeby:org
  - biz:prod:madeby:orgname
  - biz:prod:madeby:orgfqdn
  - ou:opening:posted
  - ou:opening:removed
  - ou:org:vitals
- Updates `storm-mock-http` to support multiple HTTP requests/responses in RST preprocessor. (#2317)

17.134 v2.53.0 - 2021-08-05

This release contains an automatic data migration that may cause additional startup time on the first boot. This is done to unique array properties which previously were not uniqued. Deployments with startup or liveliness probes should have those disabled while this upgrade is performed to prevent accidental termination of the Cortex process. Please ensure you have a tested backup available before applying this update.

17.134.1 Features and Enhancements

- Add an `embeds` option to Storm to allow extracting additional data when performing queries. (#2314)
- Enforce node data permissions at the Layer boundary. Remove the `node.data.get` and `node.data.list` permissions. (#2311)
- Add `auth.self.set.email`, `auth.self.set.name`, `auth.self.set.passwd` permissions on users when changing those values. These permissions default to being allowed, allowing a rule to be created that can deny users from changing these values. (#2311)
- Add `$lib.inet.smtp` to allow sending email messages from Storm. (#2315)
- Warn if a LMDB commit operation takes too long. (#2316)
- Add new data types, `taxon` and `taxonomy`, to describe hierarchical taxonomies. (#2312)
- Add a new Business Development model. This allows tracking items related to contract, sales, and purchasing lifecycles. This adds the following new forms to the data model: `biz:dealtype`, `biz:prodtype`, `biz:dealstatus`, `biz:rfp`, `biz:deal`, `biz:bundle`, `biz:product`, and `biz:stake`. The Org model is also updated to add new forms for supporting parts of the business lifecycle, adding `ou:jobtype`, `ou:jobtitle`, `ou:employment`, `ou:opening`, `ou:vitals`, `ou:camptype`, and `ou:orgtype`, `ou:conttype` forms. The Person model got a new form, `ps:workhist`. (#2312)
- Add a `:deleted` property to `inet:web:post`. (#2312)
- Update the following array properties to be unique sets, and add a data model migration to update the data at rest: (#2312)
  - edu:course:prereqs

  - `edu:class:assistants`
  - `ou:org:subs`
  - `ou:org:names`
  - `ou:org:dns:mx`
  - `ou:org:locations`
  - `ou:org:industries`
  - `ou:industry:sic`
  - `ou:industry:subs`
  - `ou:industry:isic`
  - `ou:industry:naics`
  - `ou:preso:sponsors`
  - `ou:preso:presenters`
  - `ou:conference:sponsors`
  - `ou:conference:event:sponsors`
  - `ou:conference:attendee:roles`
  - `ou:conference:event:attendee:roles`
  - `ou:contract:types`
  - `ou:contract:parties`
  - `ou:contract:requirements`
  - `ou:position:reports`
  - `ps:person:names`
  - `ps:person:nicks`
  - `ps:persona:names`
  - `ps:persona:nicks`
  - `ps:education:classes`
  - `ps:contactlist:contacts`

17.134.2 Bugfixes

- Prevent renaming the `all` role. (#2313)

17.134.3 Improved Documentation

- Add documentation about Linux kernel parameteres which can be tuned to affect Cortex performance. (#2316)

17.135 v2.52.1 - 2021-07-30

17.135.1 Bugfixes

- Fix a display regression when enumerating Cron jobs with the Storm `cron.list` command. (#2309)

17.136 v2.52.0 - 2021-07-29

17.136.1 Features and Enhancements

- Add a new specification for defining input forms that a pure Storm command knows how to natively handle. (#2301)
- Add `Lib.reverse()` and `Lib.sort()` methods to Stormtypes API. (#2306)
- Add `View.parent` property in Stormtypes API. (#2306)
- Support Telepath Share objects in Storm. (#2293)
- Allow users to specify a view to run a cron job against, move a cron job to a new view, and update permission check for adding/moving cron jobs to views. (#2292)
- Add CPE and software name infomation to the `inet:flow` form. Add `it:av:prochit`, `it:exec:thread`, `it:exec:loadlib`, `it:exec:mmap`, `it:app:yara:procmatch` forms to the infotech model. Add `:names` arrays to `it:prod:soft` and `it:prod:softver` forms to assist in entity resolution of software. Add a `risk:alert` form to the risk model to allow for capturing arbitrary alerts. (#2304)
- Allow Storm packages to specify other packages they require and possible conflicts would prevent them from being installed in a Cortex. (#2307)

17.136.2 Bugfixes

- Specify the View when lifting `syn:trigger` runt nodes. (#2300)
- Update the scrape URL regular expression to ignore trailing periods and commas. (#2302)
- Fix a bug in Path scope for nodes yielding by pure Storm commands. (#2305)

17.137 v2.51.0 - 2021-07-26

17.137.1 Features and Enhancements

- Add a `--size` option to the Storm `divert` command to limit the number of times the generator is iterated. (#2297)
- Add a `perms` key to the pure Storm command definition. This allows for adding intuitive permission boundaries for pure Storm commands which are checked prior to command execution. (#2297)

- Allow full properties with comparators when specifying the destination or source when walking light edges. (#2298)

17.137.2 Bugfixes

- Fix an issue with LMDB slabs not being backed up if their directories did not end in `.lmdb`. (#2296)

17.138 v2.50.0 - 2021-07-22

17.138.1 Features and Enhancements

- Add `.cacheget()` and `cacheset()` APIs to the Storm `node:data` object for easy caching of structured data on nodes based on time. (#2290)
- Make the Stormtypes unique properly with a Set type. This does disallow the use of mutable types such as dictionaries inside of a Set. (#2225)
- Skip executing non-runtsafe commands when there are no inbound nodes. (#2291)
- Add `asroot:perms` key to Storm Package modules. This allows package authors to easily declare permissions their packages. Add Storm commands `auth.user.add`, `auth.role.add`, `auth.user.addrule`, `auth.role.addrule`, and `pkg.perms.list` to help with some of the permission management. (#2294)

17.139 v2.49.0 - 2021-07-19

17.139.1 Features and Enhancements

- Add a `iden` parameter when creating Cron jobs to allow the creation of jobs with stable identifiers. (#2264)
- Add `$lib.cell` Stormtypes library to allow for introspection of the Cortex from Storm for Admin users. (#2285)
- Change the Telepath Client connection loop error logging to log at the Error level instead of the Info level. (#2283)
- Make the tag part normalization more resilient to data containing non-word characters. (#2289)
- Add `$lib.tags.prefix()` Stormtypes to assist with normalizing a list of tags with a common prefix. (#2289)
- Do not allow the Storm `divert` command to work with non-generator functions. (#2282)

17.139.2 Bugfixes

- Fix an issue with Storm command execution with non-runtsafe options. (#2284)
- Log when the process pool fails to initialize. This may occur in certain where CPython multiprocessing primitives are not completely supported. (#2288)
- In the Telepath Client, fix a race condition which could have raised an AttributeError in Aha resolutions. (#2286)
- Prevent the reuse of a Telepath Client object when it has been fini'd. (#2286)
- Fix a race condition in the Aha server when handling distributed changes which could have left the service in a desynchronized state. (#2287)

17.139.3 Improved Documentation

- Update the documentation for the `synapse.tools.feed` tool. (#2279)

17.140 v2.48.0 - 2021-07-13

17.140.1 Features and Enhancements

- Add a Storm `divert` command to ease the implementation of `--yield` constructs in Storm commands. This optionally yields nodes from a generator, or yields inbound nodes, while still ensuring the generator is conusmed. (#2277)
- Add Storm runtime debug tracking. This is a boolean flag that can be set or unset via `$lib.debug`. It can be used by Storm packages to determine if they should take extra actions, such as additional print statements, without needing to track additional function arguments in their implementations. (#2278)

17.140.2 Bugfixes

- Fix an ambiguity in the Storm grammar. (#2280)
- Fix an issue where form autoadds could fail to be created in specific cases of the model. (#2273)

17.141 v2.47.0 - 2021-07-07

17.141.1 Features and Enhancements

- Add `$lib.regex.replace()` Stormtypes API to perform regex based replacement of string parts. (#2274)
- Add universal properties to the dictionary returned by `Cortex.getModelDict()` as a `univs` key. (#2276)
- Add additional `asyncio.sleep(0)` statements to `Layer._storNodeEdits` to improve Cortex responsiveness when storing large numbers of edits at once. (#2275)

17.142 v2.46.0 - 2021-07-02

17.142.1 Features and Enhancements

- Update the Cortex `storm:log:level` configuration value to accept string values such as `DEBUG`, `INFO`, etc. The default log level for Storm query logs is now `INFO` level. (#2262)
- Add `$lib.regex.findall()` Stormtypes API to find all matching parts of a regular expression in a given string. (#2265)
- Add `$lib.inet.http.head()` Stormtypes API to perform easy HEAD requests, and `allow_redirects` arguments to existing `lib.inet.http` APIs to allow controlling the redirect behavior. (#2268)
- Add `$lib.storm.eval()` API to evaluate Storm values from strings. (#2269)
- Add `getSystemInfo()` and `getBackupInfo()` APIS to the Cell for getting useful system information. (#2267)
- Allow lists in rstorm bodies. (#2261)

- Add a `:desc` secondary property to the `proj:sprint` form. (#2261)
- Call _normStormPkg in all loadStormPkg paths, move validation to post normalization and remove mutation in validator (#2260)
- Add `SYN_SLAB_COMMIT_PERIOD` environment variable to control the Synapse slab commit period. Add `layer:lmdb:max_replay_log` Cortex option to control the slab replay log size. (#2266)
- Update Ahacell log messages. (#2270)

17.142.2 Bugfixes

- Fix an issue where the `Trigger.pack()` method failed when the user that created the trigger had been deleted. (#2263)

17.142.3 Improved Documentation

- Update the Cortex devops documentation for the Cortex to document the Storm query logging. Update the Cell devops documentation to explain the Cell logging and how to enable structured (JSON) logging output. (#2262)
- Update Stormtypes API documentation for `bool`, `proj:epic`, `proj:epics`, `proj:ticket`, `proj:tickets`, `proj:sprint`, `proj:sprints`, `proj:project`, `stix:bundle` types. (#2261)

17.143 v2.45.0 - 2021-06-25

17.143.1 Features and Enhancements

- Add a application level process pool the base Cell implemenation. Move the processing of Storm query text into the process pool. (#2250) (#2259)
- Minimize the re-validation of Storm code on Cortex boot. (#2257)
- Add the `ou:preso` form to record conferences and presentations. Add a `status` secondary property to the `it:mitre:attack:technique` form to track if techniques are current, deprecated or withdrawn. (#2254)

17.143.2 Bugfixes

- Remove incorrect use of `cmdopts` in Storm command definitions unit tests. (#2258

17.144 v2.44.0 - 2021-06-23

This release contains an automatic data migration that may cause additional startup time on the first boot. This only applies to a Cortex that is using user defined tag properties or using `ps:person:name` properties. Deployments with startup or liveliness probes should have those disabled while this upgrade is performed to prevent accidental termination of the Cortex process. Please ensure you have a tested backup available before applying this update.

17.144.1 Features and Enhancements

- Add a `.move()` method on Stormtypes `trigger` objects to allow moving a Trigger from one View to another View. (#2252)
- When the Aha service marks a service as down, log why that service is being marked as such. (#2255)
- Add `:budget:price` property to the `ou:contract` form. Add `:settled` property to the `econ:purchase` form. (#2253

17.144.2 Bugfixes

- Make the array property `ps:person:names` a unique array property. (#2253
- Add missing tagprop key migration for the bybuidv3 index. (#2256)

17.145 v2.43.0 - 2021-06-21

17.145.1 Features and Enhancements

- Add a `.type` string to the Stormtypes `auth:gate` object to allow a user to identify the type of auth gate it is. (#2238)
- Add `$lib.user.iden` reference to the Stormtype `$lib.user` to get the iden of the current user executing Storm code. (#2236)
- Add a `--no-build` option to `synapse.tools.genpkg` to allow pushing an a complete Storm Package file. (#2231) (#2232) (#2233)
- The Storm `movetag` command now checks for cycles when setting the `syn:tag:isnow` property. (#2229)
- Deprecate the `ou:org:has` form, in favor of using light edges for storing those relationships. (#2234)
- Add a `description` property to the `ou:industry` form. (#2239)
- Add a `--name` parameter to the Storm `trigger.add` command to name triggers upon creation. (#2237)
- Add `regx` to the `BadTypeValu` exception of the `str` type when a regular expression fails to match. (#2240)
- Consolidate Storm parsers to a single Parser object to improve startup time. (#2247)
- Improve error logging in the Cortex `callStorm()` and `storm()` APIs. (#2243)
- Add `from:contract`, `to:contract`, and `memo` properties to the `econ:acct:payment` form. (#2248)
- Improve the Cell backup streaming APIs link cleanup. (#2249)

17.145.2 Bugfixes

- Fix issue with grabbing the incorrect Telepath link when performing a Cell backup. (#2246)
- Fix missing `toprim` calls in `$lib.inet.http.connect()`. (#2235)
- Fix missing Storm command form hint schema from the Storm Package schema. (#2242)

17.145.3 Improved Documentation

- Add documentation for deprecated model forms and properties, along with modeling alternatives. (#2234)
- Update documentation for the Storm `help` command to add examples of command substring matching. (#2241)

17.146 v2.42.2 - 2021-06-11

17.146.1 Bugfixes

- Protect against a few possible RuntimeErrors due to dictionary sizes changing during iteration. (#2227)
- Fix StormType `Lib` lookups with imported modules which were raising a `TypeError` instead of a `NoSuchName` error. (#2228)
- Drop old Storm Packages if they are present when re-adding them. This fixes an issue with runtime updates leaving old commands in the Cortex. (#2230)

17.147 v2.42.1 - 2021-06-09

17.147.1 Features and Enhancements

- Add a `--no-docs` option to the `synapse.tools.genpkg` tool. When used, this not embed inline documentation into the generated Storm packages. (#2226)

17.148 v2.42.0 - 2021-06-03

17.148.1 Features and Enhancements

- Add a `--headers` and `--parameters` arguments to the Storm `wget` command. The default headers now includes a browser like UA string. (#2208)
- Add the ability to modify the name of a role via Storm. (#2222)

17.148.2 Bugfixes

- Fix an issue in the JsonStor cell where there were missing fini calls. (#2223)
- Add a missing timeout to an `getAhaSvc()` call. (#2224)
- Change how tagprops are serialized to avoid a issue with sending packed nodes over HTTP APIs. This changes the packed node structure of tagprops from a dictionary keyed with `(tagname, propertyname)` to a dictionary keyed off of the `tagname`, which now points to a dictionary containing the `propertyname` which represents the value of the tagprop. (*#2221* <https://github.com/vertexproject/synapse/pull/2221>`_)

17.149 v2.41.1 - 2021-05-27

17.149.1 Bugfixes

- Add PR #2117 to bugfix list in CHANGLOG.rst for v2.41.0 :D

17.150 v2.41.0 - 2021-05-27

17.150.1 Features and Enhancements

- Add an `it:cmd` form and update the `it:exec:proc:cmd` property to use it. This release includes an automatic data migration on startup to update the `it:exec:proc:cmd` on any existing `it:exec:proc` nodes. (#2219)

17.150.2 Bugfixes

- Fix an issue where passing a Base object to a sub-runtime in Storm did not correctly increase the reference count. (#2216)
- Fix an issue where the `tee` command could potentially run the specified queries twice. (#2218)
- Fix for rstorm using mock when the HTTP body is bytes. (#2217)

17.151 v2.40.0 - 2021-05-26

17.151.1 Features and Enhancements

- Add a `--parallel` switch to the `tee` Storm command. This allows for all of the Storm queries provided to the `tee` command to execute in parallel, potentially producing a mixed output stream of nodes. (#2209)
- Convert the Storm Runtime object in a Base object, allowing for reference counted Storm variables which are made from Base objects and are properly torn down. (#2203)
- Add `$lib.inet.http.connect()` method which creates a Websocket object inside of Storm, allowing a user to send and receive messages over a websocket. (#2203)
- Support pivot join operations on tags. (#2213)
- Add `stormrepr()` implementation for `synapse.lib.stormtypes.Lib`, which allows for `$lib.print()` to display useful strings for Storm Libraries and imported modules. (#2212)
- Add a storm API top updated a user name. (#2214)

17.151.2 Bugfixes

- Fix the logger name for `synapse.lib.aha`. (#2210)
- Log `ImportError` exceptions in `synapse.lib.dyndeps.getDynMod`. This allows easier debugging when using the `synapse.servers.cell` server when running custom Cell implementations. (#2211)
- Fix an issue where a Storm command which failed to set command arguments successfully would not teardown the Storm runtime. (#2212)

17.152 v2.39.1 - 2021-05-21

17.152.1 Bugfixes

- Fix an issue with referencing the Telepath user session object prior to a valid user being set. (#2207)

17.153 v2.39.0 - 2021-05-20

17.153.1 Features and Enhancements

- Add more useful output to Storm when printing heavy objects with `$lib.print()`. (#2185)
- Check rule edits for roles against provided authgates in Storm. (#2199)
- Add `Str.rsplit()` and maxsplit arguments to `split()/rsplit()` APIs in Storm. (#2200)
- Add default argument values to the output of Storm command help output. (#2198)
- Add a `syn:tag:part` Type and allow the `syn:tag` type to normalize a list of tag parts to create a tag string. This is intended to be used with the `$lib.cast()` function in Storm. (#2192)
- Add debug logging to the Axon for reading, writing, or deleting of blobs. (#2202)
- Add a timeout argument to the `$lib.inet.http` functions. The functions will all now always return a `inet:http:resp` object; if the `.code` is -1, an unrecoverable exception occurred while making the request. (#2205)
- Add support for embedding a logo and documentation into a Storm Package. (#2204)

17.153.2 Bugfixes

- Fix export filters to correctly filter tagprops. (#2196)
- Fix an issue with Hotcount which prevented it from storing negative values. (#2197)
- Fix an issue where `hideconf` configuration values were being included in autodoc output. (#2199)

17.154 v2.38.0 - 2021-05-14

17.154.1 Features and Enhancements

- Remove trigger inheritance from Views. Views will now only execute triggers which are created inside of them. (#2189)
- Remove read-only property flags from secondary properties on `file:bytes` nodes. (#2191)
- Add a simple `it:log:event` form to capture log events. (#2195)
- Add structured logging as an option for Synapse Cells. When enabled, this produces logs as JSONL sent to stderr. This can be set via the `SYN_LOG_STRUCT` environment variable, or adding the `--structured-logging` command line switch. (#2179)
- Add a `nodes.import` command to import a `.nodes` file from a URL. (#2186)
- Allow the `desc` key to View and Layer objects in Storm. This can be used to set descriptions for these objects. (#2190)
- Use the gateiden in Storm auth when modifying rules; allowing users to share Views and Layers with other users. (#2194)

17.154.2 Bugfixes

- Fix an issue with Storm Dmon deletion not behaving properly in mirror configurations. (#2188)
- Explicitly close generators in Telepath where an exception has caused the generator to exit early. (#2183)
- Fix an issue where a trigger owner not having access to a view would cause the Storm pipeline to stop. (#2189)

17.155 v2.37.0 - 2021-05-12

17.155.1 Features and Enhancements

- Add a `file:mime:image` interface to the Synapse model for recording MIME specific metadata from image files. (#2187)
- Add `file:mime:jpg`, `file:mime:tiff`, `file:mime:gif` and `file:mime:png` specific forms for recording metadata of those file types. (#2187)
- Add `$lib.pkg.has()` Stormtype API to check for for the existence of a given Storm package by name. (#2182)
- All `None / $lib.null` as input to setting a user password. This clears the password and prevents a user from being able to login. (#2181)
- Grab any Layer push/pull offset values when calling `Layer.pack()`. (#2184)
- Move the retrieval of `https:headers` from HTTP API handlers into a function so that downstream implementers can redirect where the extra values are retrieved from. (#2187)

17.155.2 Bugfixes

- Fix an issue which allowed for deleted Storm Packages to be retrieved from memory. (#2182)

17.156 v2.36.0 - 2021-05-06

17.156.1 Features and Enhancements

- Add `risk:vuln` support to the default Stix 2.1 export, and capture vulnerability information used by threat actors and in campaigns. Add the ability to validate Stix 2.1 bundles to ensure that they are Stix 2.1 CS02 compliant. Add the ability to lift Synapse nodes based on bundles which were previously exported from Synapse. The lift feature only works with bundles created with Synapse v2.36.0 or greater. (#2174)
- Add a `Str.upper()` function for uppercasing strings in Storm. (#2174)
- Automatically bump a user's StormDmon's when they are locked or unlocked. (#2177)
- Add Storm Package support to `synapse.tools.autodocs` and update the rstorm implementation to capture additional directives. (#2172)
- Tighten lark-parser version requirements. (#2175)

17.156.2 Bugfixes

- Fix reported layer size to represent actual disk usage. (#2173)

17.157 v2.35.0 - 2021-04-27

17.157.1 Features and Enhancements

- Add `:issuer:cert` and `:selfsigned` properties to the `crypto:x509:cert` form to enable modeling X509 certificate chains. (#2163)
- Add a `https:headers` configuration option to the Cell to allow setting arbitrary HTTP headers for the Cell HTTP API server. (#2164)
- Update the Cell HTTP API server to have a minimum TLS version of v1.2. Add a default `/robots.txt` route. Add `X-XSS=Protection` and `X-Content-Type-Options` headers to the default HTTP API responses. (#2164)
- Update the minimum version of LMDB to `1.2.1`. (#2169)

17.157.2 Bugfixes

- Improve the error message for Storm syntax error handling. (#2162)
- Update the layer byarray index migration to account for arrays of `inet:fqdn` values. (#2165) (#2166)
- Update the `vertexproject/synapse-aha`, `vertexproject/synapse-axon`, `vertexproject/synapse-cortex`, and `vertexproject/synapse-cryotank` Docker images to use `tini` as a default entrypoint. This fixes an issue where signals were not properly being propagated to the Cells. (#2168)
- Fix an issue with enfanged indicators which were not properly being lifted by Storm when operating in `lookup` mode. (#2170)

17.158 v2.34.0 - 2021-04-20

17.158.1 Features and Enhancements

- Storm function definitions now allow keyword arguments which may have default values. These must be read-only values. (#2155) (#2157)
- Add a `getCellInfo()` API to the `Cell` and `CellAPI` classes. This returns metadata about the cell, its version, and the currently installed Synapse version. Cell implementers who wish to expose Cell specific version information must adhere to conventiosn documented in the API docstrings of the function. (#2151)
- Allow external Storm modules to be added in genpkg definitions. (#2159)

17.158.2 Bugfixes

- The `$lib.layer.get()` Stormtypes returned the top layer of the default view in the Cortex when called with no arguments, instead of the top layer of the current view. This now returns the top layer of the current view. (#2156)
- Avoid calling `applyNodeEdit` when editing a tag on a Node and there are no edits to make. (#2161)

17.158.3 Improved Documentation

- Fix typo in docstrings from `$lib.model.tags` Stormtypes. (#2160)

17.159 v2.33.1 - 2021-04-13

17.159.1 Bugfixes

- Fix a regression when expanding list objects in Storm. (#2154)

17.160 v2.33.0 - 2021-04-12

17.160.1 Features and Enhancements

- Add CWE and CVSS support to the `risk:vuln` form. (#2143)
- Add a new Stormtypes library, `$lib.infosec.cvss`, to assist with parsing CVSS data, computing scores, and updating `risk:vuln` nodes. (#2143)
- Add ATT&CK, CWD, and CPE support to the IT model. (#2143)
- Add `it:network`, `it:domain`, `it:account`, `it:group` and `it:login` guid forms to model common IT concepts. (#2096)
- Add a new model, `project`, to model projects, tickets, sprints and epics. The preliminary forms for this model include `proj:project`, `proj:sprint`, `proj:ticket`, `proj:comment`, and `projec:project`. (#2096)
- Add a new Stormtypes library, `$lib.project`, to assist with using the project model. The API is provisional. (#2096)
- Allow lifting `guid` types with the prefix (`^=`) operator. (#2096)

- Add `ou:contest:result:url` to record where to find contest results. (#2144)
- Allow subquery as a value in additional places in Storm. This use must yield exactly one node. Secondary property assignments to array types may yield multiple nodes. (#2137)
- Tighten up Storm iterator behavior on the backend. This should not have have user-facing changes in Storm behavior. (#2148) (#2096)
- Update the Cell backup routine so that it blocks the ioloop less. (#2145)
- Expose the remote name and version of Storm Services in the `service.list` command. (#2149)
- Move test deprecated model elements into their own Coremodule. (#2150)
- Update `lark` dependency. (#2146)

17.160.2 Bugfixes

- Fix incorrect grammer in model.edge commands. (#2147)
- Reduce unit test memory usage. (#2152)
- Pin `jupyter-client` library. (#2153)

17.161 v2.32.1 - 2021-04-01

17.161.1 Features and Enhancements

- The Storm `$lib.exit()` function now takes message arguments similar to `$lib.warn()` and fires that message into the run time as a `warn` prior to stopping the runtime. (#2138)
- Update `pygments` minimum version to `v2.7.4`. (#2139)

17.161.2 Bugfixes

- Do not allow light edge creation on runt nodes. (#2136)
- Fix backup test timeout issues. (#2141)
- Fix the `synapse.lib.msgpack.en()` function so that now raises the correct exceptions when operating in fallback mode. (#2140)
- Fix the `Snap.addNodes()` API handling of deprecated model elements when doing bulk data ingest. (#2142)

17.162 v2.32.0 - 2021-03-30

17.162.1 Features and Enhancements

- Increase the verbosity of logging statements related to Cell backup operations. This allows for better visibility into what is happening while a backup is occurring. (#2124)
- Add Telepath and Storm APIs for setting all the roles of a User at once. (#2127)
- Expose the Synapse package commit hash over Telepath and Stormtypes. (#2133)

17.162.2 Bugfixes

- Increase the process spawn timeout for Cell backup operations. Prevent the Cell backup from grabbing lmdb transactions for slabs in the cell local tmp directory. (#2124)

17.163 v2.31.1 - 2021-03-25

17.163.1 Bugfixes

- Fix a formatting issue preventing Python packages from being uploaded to PyPI. (#2131)

17.164 v2.31.0 - 2021-03-24

17.164.1 Features and Enhancements

- Add initial capability for exporting STIX 2.1 from the Cortex. (#2120)
- Refactor how lift APIs are implemented, moving them up to the Cortex itself. This results in multi-layer lifts now yielding nodes in a sorted order. (#2093) (#2128)
- Add `$lib.range()` Storm function to generate ranges of integers. (#2122)
- Add an `errok` option to the `$lib.time.parse()` Storm function to allow the function to return `$lib.null` if the time string fails to parse. (#2126)
- Don't execute Cron jobs, Triggers, or StormDmons for locked users. (#2123) (#2129)
- The `git` commit hash is now embedded into the `synapse.lib.version` module when building PyPi packages and Docker images. (#2119)

17.164.2 Improved Documentation

- Update Axon wget API documentation to note that we always store the body of the HTTP response, regardless of status code. (#2125)

17.165 v2.30.0 - 2021-03-17

17.165.1 Features and Enhancements

- Add `$lib.trycast()` to allow for Storm control flow based on type normalization. (#2113)

17.165.2 Bugfixes

- Resolve a bug related to pivoting to a secondary property that is an array value. (#2111)
- Fix an issue with Aha and persisting the online state of services upon startup. (#2103)
- Convert the type of `inet:web:acct:singup:client:ipv6` from a `inet:ipv4` to an `inet:ipv6`. (#2114)
- Fix an idempotency issue when deleting a custom form. (#2112)

17.165.3 Improved Documentation

- Update README.rst. (#2115) (#2117) (#2116)

17.166 v2.29.0 - 2021-03-11

This release includes a Cortex storage Layer bugfix. It does an automatic upgrade upon startup to identify and correct invalid array index values. Depending on time needed to perform this automatic upgrade, the Cortex may appear unresponsive. Deployments with startup or liveliness probes should have those disabled while this upgrade is performed to prevent accidental termination of the Cortex process.

17.166.1 Features and Enhancements

- Add a `reverse` argument to `$lib.sorted()` to allow a Storm user to easily reverse an iterable item. (#2109)
- Update minimum required versions of Tornado and PyYAML. (#2108)

17.166.2 Bugfixes

- Fix an issue with Array property type deletion not properly deleting values in the `byarray` index. This requires an automatic data migration done at Cortex startup to remove extra index values which may be present in the index. (#2104) (#2106)
- Fix issues with using the Storm ?= operator with types which can generate multiple values from a given input string when making nodes. (#2105) (#2107)

17.166.3 Improved Documentation

- Add Devops documentation explaining our Docker container offerings. (#2104) (#2110)

17.167 v2.28.1 - 2021-03-08

17.167.1 Bugfixes

- Fix `$lib.model.prop()` API when called with a universal property. It now returns `$lib.null` instead of raising an exception. (#2100)
- Fix the streaming backup API when used with Telepath and SSL. (#2101)

17.167.2 Improved Documentation

- Add API documentation for the Axon. (#2098)
- Update the Storm pivot reference documentation. (#2101)

17.168 v2.28.0 - 2021-02-26

17.168.1 Features and Enhancements

- Add `String.reverse()` Stormtypes API to reverse a string. (#2086)
- Add Cell APIs for streaming compressed backups. (#2084) (#2091)
- Refactor `snap.addNodes()` to reduce the transaction count. (#2087) (#2090)
- Add `$lib.axon.list()` Stormtypes API to list hashes in an Axon. (#2088)
- Add user permissions requirements for Aha CSR signing. (#2089)
- Add `aha:svcinfo` configuration option for the base Cell. (#2089)
- Add interfaces to the output of `model.getModelDefs()` and the `getModelDict()` APIs. (#2092)
- Update pylmdb to `v1.1.1`. (#2076)

17.168.2 Bugfixes

- Fix incorrect permissions check in the `merge --diff` Storm command. (#2085)
- Fix service teardown issue in Aha service on fini. (#2089)
- Fix possible `synapse.tools.cmdr` teardown issue when using Aha. (#2089)
- Cast `synapse_minversion` from Storm Packages into a tuple to avoid packages added with HTTP endpoints from failing to validate. (#2095)

17.168.3 Improved Documentation

- Add documentation for the Aha discovery service. (#2089)
- Add documentation for assigning secondary properties via subquery syntax. (#2097)

17.169 v2.27.0 - 2021-02-16

17.169.1 Features and Enhancements

- Allow property assignment and array operations from subqueries. (#2072)
- Add APIs to the Axon to allow the deletion of blobs via Telepath and HTTP APIs. (#2080)
- Add a `str.slice()` stormtypes method to allow easy string slicing. (#2083)
- Modularize the Storm HTTP API handlers. (#2082)

17.169.2 Bugfixes

- Fix Agenda events which were not being properly tracked via the Nexus. (#2078)

17.169.3 Improved Documentation

- Add documentation for the Cortex `/api/v1/storm/export` HTTP endpoint. This also included documentation for the scrub option in Storm. (#2079)
- Add a Code of Conduct for Synapse. (#2081)

17.170 v2.26.0 - 2021-02-05

17.170.1 Features and Enhancements

- Add Storm commands for easily adding, deleting, and listing layer push and pull configurations. (#2071)

17.170.2 Bugfixes

- Fix `layer.getPropCount()` API for universal properties. (#2073)
- Add a missing async yield in `Snap.addNodes()`. (#2074)
- Constrain lmdb version due to unexpected behavior in `v1.1.0`. (#2075)

17.170.3 Improved Documentation

- Update user docs for Storm flow control and data model references. (#2066)

17.171 v2.25.0 - 2021-02-01

17.171.1 Features and Enhancements

- Implement tag model based pruning behavior for controlling how individual tag trees are deleted from nodes. (#2067)
- Add model interfaces for defining common sets of properties for forms, starting with some file mime metadata. (#2040)
- Add `file:mime:msdoc`, `file:mime:msxls`, `file:mime:msppt`, and `file:mime:rtf` forms. (#2040)
- Tweak the ival normalizer to auto-expand intervals with a single element. (#2070)
- Removed the experimental `spawn` feature of the Storm runtime. (#2068)

17.171.2 Bugfixes

- Add a missing async yield statement in `View.getEdgeVerbs()`. (#2069)

17.171.3 Improved Documentation

- Correct incorrect references to the `synapse.tools.easycert` documentation. (#2065)

17.172 v2.24.0 - 2021-01-29

17.172.1 Features and Enhancements

- Add support for storing model metadata for tags and support for enforcing tag trees using regular expressions. (#2056)
- Add `ou:contest:url` secondary property. (#2059)
- Add `synapse.lib.autodoc` to collect some Storm documentation helpers into a single library. (#2034)
- Add `tag.prune` Storm command to remove parent tags when removing a leaf tag from a node. (#2062)
- Update the `msgpack` Python dependency to version `v1.0.2`. (#1735)
- Add logs to Cell backup routines. (#2060)
- Export the Layer iterrows APIs to the CoreApi. (#2061)

17.172.2 Bugfixes

- Do not connect to Aha servers when they are not needed. (#2058)
- Make the array property `ou:org:industries` a unique array property. (#2059)
- Add permission checks to the Storm `movetag` command. (#2063)
- Add permissions checks to the Storm `edges.del` command. (#2064)

17.172.3 Improved Documentation

- Add documentation for the `synapse.tools.genpkg` utility, for loading Storm packages into a Cortex. (#2057)
- Refactor the Stormtypes documentation generation to make it data driven. (#2034)

17.173 v2.23.0 - 2021-01-21

17.173.1 Features and Enhancements

- Add support for ndef based light edge definitions in the `syn.nodes` feed API. (#2051) (#2053)
- Add ISIC codes to the `ou:industry` form. (#2054) (#2055)
- Add secondary properties `:loc`, `:latlong`, and `:place` to the `inet:web:action` and `inet:web:logon` forms. (#2052)

- Add secondary property `:enabled` to the form `it:app:yara:rule`. (#2052)
- Deprecate the `file:string` and `ou:member` forms, in favor of using light edges for storing those relationships. (#2052)

17.174 v2.22.0 - 2021-01-19

17.174.1 Features and Enhancements

- Allow expression statements to be used in Storm filters. (#2041)
- Add `file:subfile:path` secondary property to record the path a file was stored in a parent file. The corresponding `file:subfile:name` property is marked as deprecated. (#2043)
- Make the Axon `wget()` timeout a configurable parameter. (#2047)
- Add a `Cortex.exportStorm()` on the Cortex which allows for exporting nodes from a Storm query which can be directly ingested with the `syn.nodes` feed function. If the data is serialized using msgpack and stored in a Axon, it can be added to a Cortex with the new `Cortex.feedFromAxon()` API. A new HTTP API, `/api/v1/storm/export`, can be used to get a msgpacked file using this export interface. (#2045)

17.174.2 Bugfixes

- Fix issues in the Layer push and pull loop code. (#2044) (#2048)
- Add missing `toprim()` and `tostr()` calls for the Stormtypes Whois guid generation helpers. (#2046)
- Fix behavior in the Storm lookup mode which failed to lookup some expected results. (#2049)
- Fix `$lib.pkg.get()` return value when the package is not present. (#2050)

17.175 v2.21.1 - 2021-01-04

17.175.1 Bugfixes

- Fix a variable scoping issue causing a race condition. (#2042)

17.176 v2.21.0 - 2020-12-31

17.176.1 Features and Enhancements

- Add a Storm `wget` command which will download a file from a URL using the Cortex Axon and yield `inet:urlfile` nodes. (#2035)
- Add a `--diff` option to the `merge` command to enumerate changes. (#2037)
- Allow StormLib Layer API to dynamically update a Layer's logedits setting. (#2038)
- Add StormLib APIs for adding and deleting extended model properties, forms and tag properties. (#2039)

17.176.2 Bugfixes

- Fix an issue with the JsonStor not created nested entries properly. (#2036)

17.177 v2.20.0 - 2020-12-29

17.177.1 Features and Enhancements

- Correct the StormType `Queue.pop()` API to properly pop and return only the item at the specified index or the next entry in the Queue. This simplifies the intent behind the `.pop()` operation; and removes the `cull` and `wait` parameters which were previously on the method. (#2032)

17.177.2 Bugfixes

- Use `resp.iter_chunked` in the Axon `.wget()` API to improve compatibility with some third party libraries. (#2030)
- Require the use of a msgpack based deepcopy operation in handling storage nodes. (#2031)
- Fix for ambiguous whitespace in Storm command argument parsing. (#2033)

17.178 v2.19.0 - 2020-12-27

17.178.1 Features and Enhancements

- Add APIs to remove decommissioned services from AHA servers.
- Add (optional) explicit network parameters to AHA APIs. (#2029)
- Add cell.isCellActive() API to differentiate leaders/mirrors. (#2028)
- Add pop() method to Storm list objects. (#2027)

17.178.2 Bugfixes

- Fix bug in dry-run output of new merge command. (#2026)

17.179 v2.18.1 - 2020-12-24

17.179.1 Bugfixes

- Make syncIndexEvents testing more resiliant
- Make syncIndexEvents yield more often when filtering results (#2025)
- Update push/pull tests to use new waittask() API
- Raise clear errors in ambiguous use of node.tagglobs() API
- Update model docs and examples for geo:latitude and geo:longitude

- Support deref form names in storm node add expressions (#2024)
- Update tests to normalize equality comparison values (#2023)

17.180 v2.18.0 - 2020-12-23

17.180.1 Features and Enhancements

- Added axon.size() API and storm plumbing (#2020)

17.180.2 Bugfixes

- Fix active coro issue uncovered with cluster testing (#2021)

17.181 v2.17.1 - 2020-12-22

17.181.1 Features and Enhancements

- Added (BETA) RST pre-processor to embed Storm output into RST docs. (#1988)
- Added a `merge` command to allow per-node Layer merge operations to be done. (#2009)
- Updated storm package format to include a semver version string. (#2016)
- Added telepath proxy getPipeline API to minimize round-trip delay. (#1615)
- Added Node properties iteration and setitem APIs to storm. (#2011)

17.181.2 Bugfixes

- Fixes for active coro API and internal layer API name fixes. (#2018)
- Allow :prop -+> * join syntax. (#2015)
- Make getFormCount() API return a primitive dictionary. (#2014)
- Make StormVarListError messages more user friendly. (#2013)

17.182 v2.17.0 - 2020-12-22

`2.17.0` was not published due to CI issues.

17.183 v2.16.1 - 2020-12-17

17.183.1 Features and Enhancements

- Allow the `matchdef` used in the `Layer.syncIndexEvents()` API to match on tagprop data. (#2010)

17.183.2 Bugfixes

- Properly detect and raise a client side exception in Telepath generators when the underlying Link has been closed. (#2008)
- Refactor the Layer push/push test to not reach through the Layer API boundary. (#2012)

17.183.3 Improved Documentation

- Add documentation for Storm raw pivot syntax. (#2007)
- Add documentation for recently added Storm commands. (#2007)
- General cleanup and clarifications. (#2007)

17.184 v2.16.0 - 2020-12-15

17.184.1 Features and Enhancements

- Replaced the View sync APIs introduced in `v2.14.0` with Layer specific sync APIs. (#2003)
- Add `$lib.regex.matches()` and `$lib.regex.search()` Stormtypes APIs for performing regular expression operations against text in Storm. (#1999) (#2005)
- Add `synapse.tools.genpkg` for generating Storm packages and loading them into a Cortex. (#2004)
- Refactored the StormDmon implementation to use a single async task and allow the Dmons to be restarted via `$lib.dmon.bump(iden)`. This replaces the outer task / inner task paradigm that was previously present. Also add the ability to persistently disable and enable a StomDmon. (#1998)
- Added `aha://` support to the `synapse.tools.pushfile` and `synapse.tools.pullfile` tools. (#2006)

17.184.2 Bugfixes

- Properly handle whitespace in keyword arguments when calling functions in Storm. (#1997)
- Fix some garbage collection issues causing periodic pauses in a Cortex due to failing to close some generators used in the Storm Command AST node. (#2001) (#2002)
- Fix scope based permission checks in Storm. (#2000)

17.185 v2.15.0 - 2020-12-11

17.185.1 Features and Enhancements

- Add two new Cortex APIs: `syncIndexEvents` and `syncLayerEvents` useful for external indexing. (#1948) (#1996)
- LMDB Slab improvements: Allow dupfixed dbs, add `firstkey` method, inline `_ispo2`, add HotCount deletion. (#1948)
- Add method to merge sort sorted async generators. (#1948)

17.185.2 Bugfixes

- Ensure parent FQDN exists even in out-of-order node edit playback. (#1995)

17.186 v2.14.2 - 2020-12-10

17.186.1 Bugfixes

- Fix an issue with the new layer push / pull code. (#1994)
- Fix an issue with the url sanitization function when the path contains an `@` character. (#1993)

17.187 v2.14.1 - 2020-12-09

17.187.1 Features and Enhancements

- Add a `/api/v1/active` HTTP API to the Cell that can be used as an unauthenticated liveliness check. (#1987)
- Add `$lib.pip.gen()` Stormtypes API for ephemeral queues and bulk data access in Storm. (#1986)
- Add a `$lib.model.tagprop()` Stormtypes API for retrieving Tagprop definitions. (#1990)
- Add efficient View and Layer push/pull configurations. (#1991) (#1992)
- Add `getAhaUrls()` to the Aha service to prepare for additional service discovery. (#1989)
- Add a `/api/v1/auth/onepass/issue` HTTP API for an admin to mint a one-time password for a Cell user. (#1982)

17.187.2 Bugfixes

- Make `aha://` urls honor local paths. (#1985)

17.188 v2.14.0 - 2020-12-09

`2.14.0` was not published due to CI issues.

17.189 v2.13.0 - 2020-12-04

17.189.1 Features and Enhancements

- Add `$lib.pkg.get()` StormTypes function to get the Storm Package definition for a given package by name. (#1983)

17.189.2 Bugfixes

- The user account provisioned by the `aha:admin` could be locked out. Now, upon startup, if they have been locked out or had their admin status removed, they are unlocked and admin is reset. (#1984)

17.190 v2.12.3 - 2020-12-03

17.190.1 Bugfixes

- Prevent OverflowError exceptions which could have resulted from lift operations with integer storage types. (#1980)
- Remove `inet:ipv4` norm routine wrap-around behavior for integers which are outside the normal bounds of IPv4 addresses. (#1979)
- Fix `view.add` and fork related permissions. (#1981)
- Read `telepath.yaml` when using the `synapse.tools.cellauth` tool. (#1981)

17.191 v2.12.2 - 2020-12-01

This release also includes the changes from v2.12.1, which was not released due to an issue with CI pipelines.

17.191.1 Bugfixes

- Add the missing API `getPathObjs` on the JsonStorCell. (#1976)
- Fix the HasRelPropCond AST node support for Storm pivprop operations. (#1972)
- Fix support for the `aha:registry` config parameter in a Cell to support an array of strings. (#1975)
- Split the `Cortex.addForm()` Nexus handler into two parts to allow for safe event replay. (#1978)
- Stop forking a large number of child layers in a View persistence test. (#1977)

17.192 v2.12.1 - 2020-12-01

17.192.1 Bugfixes

- Add the missing API `getPathObjs` on the JsonStorCell. (#1976)
- Fix the HasRelPropCond AST node support for Storm pivprop operations. (#1972)
- Fix support for the `aha:registry` config parameter in a Cell to support an array of strings. (#1975)

17.193 v2.12.0 - 2020-11-30

17.193.1 Features and Enhancements

- Add a `onload` paramter to the `stormpkg` definition. This represents a Storm query which is executed every time the `stormpkg` is loaded in a Cortex. (#1971) (#1974)
- Add the ability, in Storm, to unset variables, remove items from dictionaries, and remove items from lists. This is done via assigning `$lib.undef` to the value to be removed. (#1970)
- Add support for SOCKS proxy support for outgoing connections from an Axon and Cortex, using the `'http:proxy` configuration option. This configuration value must be a valid string for the `aiohttp_socks.ProxyConnector.from_url()` API. The SOCKS proxy is used by the Axon when downloading files; and by the Cortex when making HTTP connections inside of Storm. (#1968)
- Add `aha:admin` to the Cell configuration to provide a common name that is used to create an admin user for remote access to the Cell via the Aha service. (#1969)
- Add `auth:ctor` and `auth:conf` config to the Cell in order to allow hooking the construction of the `HiveAuth` object. (#1969)

17.194 v2.11.0 - 2020-11-25

17.194.1 Features and Enhancements

- Optimize Storm lift and filter queries, so that more efficient lift operations may be performed in some cases. (#1966)
- Add a `Axon.wget()` API to allow the Axon to retrieve files directly from a URL. (#1965)
- Add a JsonStor Cell, which allows for hierarchical storage and retrieval of JSON documents. (#1954)
- Add a Cortex HTTP API, `/api/v1/storm/call`. This behaves like the `CoreApi.callStorm()` API. (#1967)
- Add `:client:host` and `:server:host` secondary properties to the `inet:http:request` form. (#1955)
- Add `:host` and `:acct` secondary properties to the `inet:search:query` form. (#1955)
- Add a Telepath service discovery implementation, the Aha cell. The Aha APIs are currently provisional and subject to change. (#1954)

17.195 v2.10.2 - 2020-11-20

17.195.1 Features and Enhancements

- The Storm `cron.at` command now supports a `--now` flag to create a cron job which immediately executes. (#1963)

17.195.2 Bugfixes

- Fix a cleanup race that caused occasional `test_lmdbslab_base` failures. (#1962)
- Fix an issue with `EDIT_NODEDATA_SET` nodeedits missing the `oldv` value. (#1961)
- Fix an issue where `cron.cleanup` could have prematurely deleted some cron jobs. (#1963)

17.196 v2.10.1 - 2020-11-17

17.196.1 Bugfixes

- Fix a CI issue which prevented the Python `sdist` package from being uploaded to PyPi. (#1960)

17.197 v2.10.0 - 2020-11-17

17.197.1 Announcements

The `v2.10.0` Synapse release contains support for Python 3.8. Docker images are now built using a Python 3.8 image by default. There are also Python 3.7 images available as `vertexproject/synapse:master-py37` and `vertexproject/synapse:v2.x.x-py37`.

17.197.2 Features and Enhancements

- Python 3.8 release support for Docker and PyPi. (#1921) (#1956)
- Add support for adding extended forms to the Cortex. This allows users to define their own forms using the existing types which are available in the Synapse data model. (#1944)
- The Storm `and` and `or` statements now short-circuit and will return when their logical condition is first met. This means that subsequent clauses in those statements may not be executed. (#1952)
- Add a mechanism for Storm Services to specify commands which may require privilege elevation to execute. An example of this may be to allow a command to create nodes; without managning individual permissions on what nodes a user may normally be allowed to create. Services using this mechanism wiill use the `storm.asroot.cmd.<<cmd name>>` hierarchy to grant this permission. (#1953) (#1958)
- Add `$lib.json` Stormtypes Library to convert between string data and primitives. (#1949)
- Add a `parallel` command to allow for executing a portion of a Storm query in parallel. Add a `background` command to execute a Storm query as a detached task from the current query, capturing variables in the process. (#1931) (#1957)
- Add a `$lib.exit()` function to StormTypes to allow for quickly exiting a Storm query. (#1931)

- Add `$lib.bytes.upload()` to Stormtypes for streaming bytes into the Axon that the Cortex is configured with. (#1945)
- Add Storm commands to manage locking and unlocking deprecated model properties. (#1909)
- Add `cron.cleanup` command to make it easy to clean up completed cron jobs. (#1942)
- Add date of death properties and consistently named photo secondary properties. (#1929)
- Add model additions for representing education and awards. (#1930)
- Add additional account linkages to the `inet` model for users and groups. (#1946)
- Add `inet:web:hashtag` as its own form, and add `:hashtags` to `inet:web:post`. (#1946)
- Add `lang:translation` to capture language translations of texts in a more comprehensive way than older `lang` model forms did. The `lang:idiom` and `lang:trans` forms have been marked as deprecated. (#1946)
- Update the `ou` model to add `ou:attendee` and `ou:contest` and `ou:contest:result` forms. Several secondary properties related to conference attendance have been marked deprecated. (#1946)
- The `ps:persona` and `ps:persona:has` forms have been marked as deprecated. (#1946)
- Add `ps:contactlist` to allow collecting multiple `ps:contact` nodes together. (#1935)
- Allow the Storm Service cmdargs to accept any valid model type in the `type` value. (#1923) (#1936)
- Add >, <, >= and <= comparators for `inet:ipv4` type. (#1938)
- Add configuration options to the Axon to limit the amount of data which can be stored in it. Add a configuration option the Cortex to limit the number of nodes which may be stored in a given Cortex. (#1950)

17.197.3 Bugfixes

- Fix a potential incorrect length for Spooled sets during fallback. (#1937)
- Fix an issue with the Telepath `Client` object caching their `Method` and `GenrMethod` attributes across re-connections of the underlying `Proxy` objects. (#1939) (#1941)
- Fix a bug where a temporary spool slab cleanup failed to remove all files from the filesystem that were created when the slab was made. (#1940)
- Move exceptions which do not subclass `SynErr` out of `synapse/exc.py`. (#1947) (#1951)

17.198 v2.9.2 - 2020-10-27

17.198.1 Bugfixes

- Fix an issue where a Cortex migrated from a *01x* release could overwrite entries in a Layer's historical nodeedit log. (#1934)
- Fix an issue with the layer definition schema. (#1927)

17.199 v2.9.1 - 2020-10-22

17.199.1 Features and Enhancements

- Reuse existing an existing `DateTime` object when making time strings. This gives a slight performance boost for the `synapse.lib.time.repr()` function. (#1919)
- Remove deprecated use of `loop` arguments when calling `asyncio` primitives. (#1920)
- Allow Storm Services to define a minimum required Synapse version by the Cortex. If the Cortex is not running the minimum version, the Cortex will not load (#1900)
- Only get the nxsindx in the `Layer.storeNodeEdits()` function if logging edits. (#1926)
- Include the Node iden value in the `CantDelNode` exception when attempting to delete a Node failes due to existing references to the node. (#1926)
- Take advantage of the LMDB append operation when possible. (#1912)

17.199.2 Bugfixes

- Fix an issues in the Telepath Client where an exception thrown by a onlink function could cause additional linkloop tasks to be spawned. (#1924)

17.200 v2.9.0 - 2020-10-19

17.200.1 Announcements

The `v2.9.0` Synapse release contains an automatic Cortex Layer data migration. The updated layer storage format reduces disk and memory requirements for a layer. It is recommended to test this process with a backup of a Cortex before updating a production Cortex.

In order to maximize the space savings from the new layer storage format, after the Cortex has been migrated to `v2.9.0`, one can take a cold backup of the Cortex and restore the Cortex from that backup. This compacts the LMDB databases which back the Layers and reclaims disk space as a result. This is an optional step; as LMDB will eventually re-use the existing space on disk.

If there are any questions about this, please reach out in the Synapse Slack channel so we can assist with any data migration questions.

17.200.2 Features and Enhancements

- Optimize the layer storage format for memory size and performance. (#1877) (#1885) (#1899) (#1917)
- Initial support Python 3.8 compatibility for the core Synapse library. Additional 3.8 support (such as wheels and Docker images) will be available in future releases. (#1907)
- Add a read only Storm option to the Storm runtime. This option prevents executing commands or Stormtypes functions which may modify data in the Cortex. (#1869) (#1916)
- Allow the Telepath Dmon to disconnect clients using a ready status. (#1881)
- Ensure that there is only one online backup of a Cell occurring at a time. (#1883)

- Added `.lower()`, `.strip()`, `.lstrip()` and `.rstrip()` methods to the Stormtypes Str object. These behave like the Python `str` methods. (#1886) (#1906)
- When scraping text, defanged indicators are now refanged by default. (#1888)
- Normalize read-only property declarations to use booleans in the data model. (#1887)
- Add `lift.byverb` command to allow lifting nodes using a light edge verb. (#1890)
- Add netblock and range lift helpers for `inet:ipv6` type, similar to the helpers for `inet:ipv4`. (#1869)
- Add a `edges.del` command to bulk remove light weight edges from nodes. (#1893)
- The `yield` keyword in Storm now supports iterating over Stormtypes List and Set objects. (#1898)
- Add `ou:contract`, `ou:industry` and `it:reveng:function:strings` forms to the data model. (#1894)
- Add some display type-hinting to the data model for some string fields which may be multi-line fields. (#1892)
- Add `getFormCounts()` API to the Stormtypes View and Layer objects. (#1903)
- Allow Cortex layers to report their total size on disk. This is exposed in the Stormtypes `Layer.pack()` method for a layer. (#1910)
- Expose the remote Storm Service name in the `$lib.service.get()` Stormtypes API. This allows getting a service object without knowing the name of the service as it was locally added to a Cortex. Also add a `$lib.service.has()` API which allows checking to see if a service is available on a Cortex. (#1908) (#1915)
- Add regular expression (`~=`) and prefix matching (`^=`) expression comparators that can be used with logical expressions inside of Storm. (#1906)
- Promote `CoreApi.addFeedData()` calls to tracked tasks which can be viewed and terminated. (#1918)

17.200.3 Bugfixes

- Fixed a Storm bug where attempting to access an undeclared variable silently fails. This will now raise a `NoSuchVar` exception. This is verified at runtime, not at syntax evaluation. (#1916)
- Ensure that Storm HTTP APIs tear down the runtime task if the remote disconnects before consuming all of the messages. (#1889)
- Fix an issue where the `model.edge.list` command could block the ioloop for large Cortex. (#1890)
- Fix a regex based lifting bug. (#1899)
- Fix a few possibly greedy points in the AST code which could have resulted in greedy CPU use. (#1902)
- When pivoting across light edges, if the destination form was not a valid form, nothing happened. Now a StormRuntimeError is raised if the destination form is not valid. (#1905)
- Fix an issue with spawn processes accessing lmdb databases after a slab resize event has occurred by the main process. (#1914)
- Fix a slab teardown race seen in testing Python 3.8 on MacOS. (#1914)

17.200.4 Deprecations

- The `0.1.x` to `2.x.x` Migration tool and associated Cortex sync service has been removed from Synapse in the `2.9.0` release.

17.200.5 Improved Documentation

- Clarify user documentation for pivot out and pivot in operations. (#1891)
- Add a deprecation policy for Synapse Data model elements. (#1895)
- Pretty print large data structures that may occur in the data model documentation. (#1897)
- Update Storm Lift documentation to add the `?=` operator. (#1904)

17.201 v2.8.0 - 2020-09-22

17.201.1 Features and Enhancements

- Module updates to support generic organization identifiers, generic advertising identifiers, asnet6 and a few other secondary property additions. (#1879)
- Update the Cell backup APIs to perform a consistent backup across all slabs for a Cell. (#1873)
- Add support for a environment variable, `SYN_LOCKMEM_DISABLE` which will disable any memory locking of LMDB slabs. (#1882)

17.201.2 Deprecations

- The `0.1.x` to `2.x.x` Migration tool and and associated Cortex sync service will be removed from Synapse in the `2.9.0` release. In order to move forward to `2.9.0`, please make sure that any Cortexes which still need to be migrated will first be migrated to `2.8.x` prior to attempting to use `2.9.x`.

17.201.3 Improved Documentation

- Add Synapse README content to the Pypi page. This was a community contribution from https://github.com/wesinator. (#1872)

17.202 v2.7.3 - 2020-09-16

17.202.1 Deprecations

- The `0.1.x` to `2.x.x` Migration tool and and associated Cortex sync service will be removed from Synapse in the `2.9.0` release. In order to move forward to `2.9.0`, please make sure that any Cortexes which still need to be migrated will first be migrated to `2.8.x` prior to attempting to use `2.9.x`. (#1880)

17.202.2 Bugfixes

- Remove duplicate words in a comment. This was a community contribution from enadjoe. (#1874)
- Fix a nested Nexus log event in Storm Service deletion. The `del` event causing Storm code execution could lead to nested Nexus events, which is incongruent with how Nexus change handlers work. This now spins off the Storm code in a free-running coroutine. This does change the service `del` semantics since any support Storm packages a service had may be removed by the time the handler executes. (#1876)
- Fix an issue where the `cull` parameter was not being passed to the multiqueue properly when calling `.gets()` on a Storm Types Queue object. (#1876)
- Pin the `nbconvert` package to a known working version, as `v6.0.0` of that package broke the Synapse document generation by changing how templates work. (#1876)
- Correct `min` and `max` integer examples in tagprop documentation and tests. (#1878)

17.203 v2.7.2 - 2020-09-04

17.203.1 Features and Enhancements

- Update tests for additional test code coverage. This was a community contribution from blackout. (#1867)
- Add implicit links to documentation generated for Storm services, to allow for direct linking inside of documentation to specific Storm commands. (#1866)
- Add future support for deprecating model elements in the Synapse data model. This support will produce client and server side warnings when deprecated model elements are used or loaded by custom model extensions or CoreModules. (#1863)

17.203.2 Bugfixes

- Update `FixedCache.put()` to avoid a cache miss. This was a community contribution from blackout. (#1868)
- Fix the ioloop construction to be aware of `SYN_GREEDY_CORO` environment variable to put the ioloop into debug mode and log long-running coroutines. (#1870)
- Fix how service permissions are checked in `$lib.service.get()` and `$lib.service.wait()` Storm library calls. These APIs now first check `service.get.<service iden>` before checking `service.get.<service name>` permissions. A successful `service.get.<service name>` check will result in a warning to the client and the server. (#1871)

17.204 v2.7.1 - 2020-08-26

17.204.1 Features and Enhancements

- Refactor an Axon unit test to make it easier to test alternative Axon implementations. (#1862)

17.204.2 Bugfixes

- Fix an issue in `synapse.tools.cmdr` where it did not ensure that the users Synapse directory was created before trying to open files in the directory. (#1860) (#1861)

17.204.3 Improved Documentation

- Fix an incorrect statement in our documentation about the intrinsic Axon that a Cortex creates being remotely accessible. (#1862)

17.205 v2.7.0 - 2020-08-21

17.205.1 Features and Enhancements

- Add Telepath and HTTP API support to set and remove global Storm variables. (#1846)
- Add Cell level APIs for performing the backup of a Cell. These APIs are exposed inside of a Cortex via a Storm Library. (#1844)
- Add support for Cron name and doc fields to be editable. (#1848)
- Add support for Runtime-only (`runt`) nodes in the PivotOut operation (`-> *`). (#1851)
- Add `:nicks` and `:names` secondary properties to `ps:person` and `ps:persona` types. (#1852)
- Add a new `ou:position` form and a few associated secondary properties. (#1849)
- Add a step to the CI build process to smoke test the sdist and wheel packages before publishing them to PyPI. (#1853)
- Add support for representing `nodedata` in the command hinting for Storm command implementations and expose it on the `syn:cmd` runt nodes. (#1850)
- Add package level configuration data to Storm Packages in the `modconf` value of a package definition. This is added to the runtime variables when a Storm package is imported, and includes the `svciden` for packages which come from Storm Services. (#1855)
- Add support for passing HTTP params when using `$lib.inet.http.*` functions to make HTTP calls in Storm. (#1856)
- Log Storm queries made via the `callStorm()` and `count()` APIs. (#1857)

17.205.2 Bugfixes

- Fix an issue were some Storm filter operations were not yielding CPU time appropriately. (#1845)

17.205.3 Improved Documentation

- Remove a reference to deprecated `eval()` API from quickstart documentation. (#1858)

17.206 v2.6.0 - 2020-08-13

17.206.1 Features and Enhancements

- Support `+hh:mm` and `+hh:mm` timezone offset parsing when normalizing `time` values. (#1833)
- Enable making mirrors of Cortex mirrors work. (#1836)
- Remove read-only properties from `inet:flow` and `inet:http:request` forms. (#1840)
- Add support for setting nodedata and light edges in the `syn.nodes` ingest format. (#1839)
- Sync the LMDB Slab replay log if it gets too large instead of waiting for a force commit operation. (#1838)
- Make the Agenda unit tests an actual component test to reduce test complexity. (#1837)
- Support glob patterns when specifying files to upload to an Axon with `synapse.tools.pushfile`. (#1837)
- Use the node edit metadata to store and set the `.created` property on nodes, so that mirrors of Cortexes have consistent `.created` timestamps. (#1765)
- Support parent runtime variables being accessed during the execution of a `macro.exec` command. (#1841)
- Setting tags from variable values in Storm now calls `s_stormtypes.tostr()` on the variable value. (#1843)

17.206.2 Bugfixes

- The Storm `tree` command now catches the Synapse `RecursionLimitHit` error and raises a `StormRuntimeError` instead. The `RecursionLimitHit` being raised by that command was, in practice, confusing. (#1832)
- Resolve memory leak issues related to callStorm and Base object teardowns with exceptions. (#1842)

17.207 v2.5.1 - 2020-08-05

17.207.1 Features and Enhancements

- Add performance oriented counting APIs per layer, and expose them via Stormtypes. (#1813)
- Add the ability to clone a layer, primarily for benchmarking and testing purposes. (#1819)
- Update the benchmark script to run on remote Cortexes. (#1829)

17.207.2 Bugfixes

- Sanitize passwords from Telepath URLs during specific cases where the URL may be logged. (#1830)

17.207.3 Improved Documentation

- Fix a few typos in docstrings. (#1831)

17.208 v2.5.0 - 2020-07-30

17.208.1 Features and Enhancements

- Refactor the Nexus to remove leadership awareness. (#1785)
- Add support for client-side certificates in Telepath for SSL connections. (#1785)
- Add multi-dir support for CertDir. (#1785)
- Add a `--no-edges` option to the Storm `graph` command. (#1805)
- Add `:doc:url` to the `syn:tag` form to allow recording a URL which may document a tag. (#1805)
- Add `CoreApi.reqValidStorm()` and a `/api/v1/reqvalidstorm` Cortex HTTP API endpoint to validate that a given Storm query is valid Storm syntax. (#1806)
- Support Unicode white space in Storm. All Python *s* (Unicode white space + ASCII separators) is now treated as white space in Storm. (#1812)
- Refactor how StormLib and StormPrim objects access their object locals, and add them to a global registry to support runtime introspection of those classes. (#1804)
- Add smoke tests for the Docker containers built in CircleCI, as well as adding Docker healthchecks to the Cortex, Axon and Cryotank images. (#1815)
- Initialize the names of the default view and layer in a fresh Cortex to `default`. (#1814)
- Add HTTP API endpoints for the Axon to upload, download and check for the existend of files. (#1817) (#1822) (#1824) (#1825)
- Add a `$lib.bytes.has()` API to check if the Axon a Cortex is configured with knows about a given sha256 value. (#1822)
- Add initial model for prices, currences, securities and exchanges. (#1820)
- Add a `:author` field to the `it:app:yara:rule` form. (#1821)
- Add an experimental option to set the NexusLog as a `map_async` slab. (#1826)
- Add an initial transportation model. (#1816)
- Add the ability to dereference an item, from a list of items, in Storm via index. (#1827)
- Add a generic `$lib.inet.http.request()` Stormlib function make HTTP requests with arbitrary verbs. (#1828)

17.208.2 Bugfixes

- Fix an issue with the Docker builds for Synapse where the package was not being installed properly. (#1815)

17.208.3 Improved Documentation

- Update documentation for deploying Cortex mirrors. (#1811)
- Add automatically generated documentation for all the Storm `$lib...` functions and Storm Primitive types. (#1804)
- Add examples of creating a given Form to the automatically generated documentation for the automatically generated datamodel documentation. (#1818)
- Add additional documentation for Cortex automation. (#1797)
- Add Devops documentation for the list of user permissions relevant to a Cell, Cortex and Axon. (#1823)

17.209 v2.4.0 - 2020-07-15

17.209.1 Features and Enhancements

- Update the Storm `scrape` command to make `refs` light edges, instead of `edge:refs` nodes. (#1801) (#1803)
- Add `:headers` and `:response:headers` secondary properties to the `inet:http:request` form as Array types, so that requests can be directly linked to headers. (#1800)
- Add `:headers` secondary property to the `inet:email:messaage` form as Array types, so that messages can be directly linked to headers. (#1800)
- Add additional model elements to support recording additional data for binary reverse engineering. (#1802)

17.210 v2.3.1 - 2020-07-13

17.210.1 Bugfixes

- Prohibit invalid rules from being set on a User or Role object. (#1798)

17.211 v2.3.0 - 2020-07-09

17.211.1 Features and Enhancements

- Add `ps.list` and `ps.kill` commands to Storm, to allow introspecting the runtime tasks during (#1782)
- Add an `autoadd` mode to Storm, which will extract basic indicators and make nodes from them when executed. This is a superset of the behavior in the `lookup` mode. (#1795)
- Support skipping directories in the `synapse.tools.backup` tool. (#1792)
- Add prefix based lifting to the Hex type. (#1796)

17.211.2 Bugfixes

- Fix an issue for prop pivot out syntax where the source data is an array type. (#1794)

17.211.3 Improved Documentation

- Add Synapse data model background on light edges and update the Storm data modification and pivot references for light edges. (#1784)
- Add additional terms to the Synapse glossary. (#1784)
- Add documentation for additional Storm commands. (#1784)
- Update documentation for Array types. (#1791)

17.212 v2.2.2 - 2020-07-03

17.212.1 Features and Enhancements

- Add some small enhancements to the Cortex benchmarking script. (#1790)

17.212.2 Bugfixes

- Fix an error in the help for the `macro.del` command. (#1786)
- Fix rule indexing for the `synapse.tools.cellauth` tool to correctly print the rule offsets. (#1787)
- Remove extraneous output from the Storm Parser output. (#1789)
- Rewrite the language (and private APIs) for the Storm `model.edge` related commands to remove references to extended properties. That was confusing language which was unclear for users. (#1789)
- During 2.0.0 migrations, ensure that Cortex and Layer idens are unique; and make minimum 0.1.6 version requirement for migration. (#1788)

17.213 v2.2.1 - 2020-06-30

17.213.1 Bugfixes

- The Axon test suite was missing a test for calling `Axon.get()` on a file it did not have. This is now included in the test suite. (#1783)

17.213.2 Improved Documentation

- Improve Synapse devops documentation hierarchy. Add note about Cell directories being persistent. (#1781)

17.214 v2.2.0 - 2020-06-26

17.214.1 Features and Enhancements

- Add a `postAnit()` callback to the `synapse.lib.base.Base()` object which is called *after* the `__anit__()` call chain is completed, but before `Base.anit()` returns the object instance to the caller. This is used by the Cell to defer certain Nexus actions until the Cell has completed initializing all of its instance attributes. (#1768)
- Make `synapse.lib.msgpack.en()` raise a `SynErr.NotMsgpackSafe` exception instead of passing through the exception raised by msgpack. (#1768)

17.214.2 Bugfixes

- Add a missing `toprim()` call in `$lib.globals.set()`. (#1778)
- Fix an issue in the quickstart documentation related to permissions. Thank you `enadjoe` for your contribution. (#1779)
- Fix an Cell/Cortex startup issue which caused errors when starting up a Cortex when the last Nexus event was replayed. This has a secondary effect that Cell implementers cannot be making Nexus changes during the `__anit__` methods. (#1768)

17.214.3 Improved Documentation

- Add a minimal Storm Service example to the developer documentation. (#1776)
- Reorganize the Synapse User Guide into a more hierarchical format. (#1777)
- Fill out additional glossary items. (#1780)

17.215 v2.1.2 - 2020-06-18

17.215.1 Bugfixes

- Disallow command and bare string contensts from starting with `//` and `/*` in Storm syntax. (#1769)

17.216 v2.1.1 - 2020-06-16

17.216.1 Bugfixes

- Fix an issue in the autodoc tool which failed to account for Storm Service commands without cmdargs. (#1775)

17.217 v2.1.0 - 2020-06-16

17.217.1 Features and Enhancements

- Add information about light edges to graph carving output. (#1762)
- Add a `geo:json` type and `geo:place:geojson` property to the model. (#1759)
- Add the ability to record documentation for light edges. (#1760)
- Add the ability to delete and set items inside of a MultiQueue. (#1766)

17.217.2 Improved Documentation

- Refactor `v2.0.0` changelog documentation. (#1763)
- Add Vertex branding to the Synapse documentation. (#1767)
- Update Backups documentation in the Devops guide. (#1764)
- Update the autodoc tool to generate documentation for Cell confdefs and StormService information. (#1772)
- Update to separate the devops guides into distinct sections. (#1772)
- Add documentation for how to do boot-time configuration for a Synapse Cell. (#1772)
- Remove duplicate information about backups. (#1774)

17.218 v2.0.0 - 2020-06-08

Initial 2.0.0 release.

17.219 API Deprecation Notice - 2023-10-01

It's time to shed some long standing deprecations to reduce technical debt and prepare for some new features and subsystems! The following deprecated APIs and commands will be removed on 2023-10-01:

17.219.1 Storm Commands

- `sudo`
- `splice.list`
- `splice.undo`

17.219.2 Storm Options

- `editformat=splices`

17.219.3 Cortex Telepath APIs

- `stat()`
- `addCronJob()`
- `delCronJob()`
- `updateCronJob()`
- `enableCronJob()`
- `disableCronJob()`
- `listCronJobs()`
- `editCronJob()`
- `setStormCmd()`
- `delStormCmd()`
- `addNodeTag()`
- `delNodeTag()`
- `setNodeProp()`
- `delNodeProp()`
- `eval()`
- `watch()`
- `splices()`
- `splicesBack()`
- `spliceHistory()`
- `addFeedData(syn.splice, ...)`
- `addFeedData(syn.nodeedits, ...)`

17.219.4 Layer Telepath APIs

- `splices()`
- `splicesBack()`
- `truncate()`

17.219.5 Cmdr Commands

- `at`
- `cron`
- `trigger`
